JANUARY 2019

Figure 4-12 Inflow Locations in the Guadalupe River and Tributaries Hydraulic Model

4.4.2.3 Water Surface Elevations – Main Channel

The modeling results are shown in Table 4-5 for Alternatives 1, 2, and 3 and Table 4-6 for Alternative 4. The extents of the 100-year floodplain compared with the existing condition are shown in Figure 4-13 for Alternatives 1, 2, 3, and Figure 4-14 for Alternative 4. The changes to the 100-year floodplain elevation from the existing condition are shown in Figure 4-15 for Alternatives 1, 2, 3, and Figure 4-16 for Alternative 4.

The outputs from the hydraulic analysis for Alternatives 1, 2, 3 showed that pier columns supporting the viaduct near the Guadalupe River crossing would not raise the 100-year flood profile inside the Guadalupe River main channel. The overbank floodplain near the existing railroad bridge over Guadalupe River would be raised by approximately 0.1 foot or less during the 100-year storm event. The outputs from the hydraulic analysis for Alternative 4 showed that the proposed HSR bridge immediately upstream of the existing railroad bridge would not raise the 100-year flood profile of Guadalupe River main channel.

Project features would be required under all alternatives to lower the 100-year flood profile in the main channel and in the overbank floodplain back to the level of existing condition.

Table 4-5 Hydraulic Modeling Results, Guadalupe River, Alternatives 1, 2, and 3

Location	Flow Rate (cfs)	Channel Bank Elevation (feet NAVD 88)	WSE—Existing Condition (feet NAVD 88)	WSE—Proposed Condition (feet NAVD 88)	Change in WSE (feet)

Figure 4-16 Guadalupe River, 100-year Floodplain Elevation Change from Existing Condition to Alternative 4

4.4.2.4 Overbank Flood Flow at Almaden-Curtner Area

The modeling results for the two-dimensional floodplain analysis near the Almaden Expressway overcrossing and Curtner Avenue overcrossing over existing railroad track are shown in Figure 4-13 for existing condition, Figure 4-14 for Alternatives 1, 2, and 3 and Figure 4-15 for Alternative 4. The proposed condition with floodwalls and equalizers for Alternatives 1, 2, and 3 and Alternative 4 are shown in Figure 4-16 and Figure 4-17, respectively.

The outputs from the existing condition hydraulic analysis showed the maximum 100-year WSE elevation on the west (upstream) of existing railroad track to be approximately 132.4 to 132.5 ft NAVD 88 between Almaden Expressway overcrossing and Curtner Avenue overcrossing. The existing top of rail elevation in this area is approximately 133 ft NAVD 88 and is lower than the maximum 100-year WSE. Therefore, overbank flood flow overtopped existing railroad track and flow northwest, showing the flooding footprint similar to the FEMA FIRM (Figure 4-7 and 4-13).

The outputs from the proposed condition hydraulic analysis for Alternatives 1, 2, and 3 showed the maximum 100-year WSE elevation on the west (upstream) of existing railroad track to be approximately 132.4 ft to 132.5 ft NAVD 88 between Almaden Expressway overcrossing and Curtner Avenue overcrossing. The changes to the maximum 100-year WSE and extents of the flooded area were minimal at this location for Alternatives 1, 2, and 3 (Figure 4-14). The proposed top of rail elevation for Alternatives 1, 2, and 3 between Almaden Expressway overcrossing and Curtner Avenue overcrossing varies from approximately 125.1 ft at the local low point to approximately 134.7 ft at Curtner Avenue overcrossing. Because elevation of the local low point is lower than the maximum 100-year WSE, the overbank flood flow would overtop the proposed HSR track during the 100-year storm event.

The outputs from the proposed condition hydraulic analysis for Alternative 4 showed the maximum 100-year WSE elevation on the west (upstream) of existing railroad track to be approximately 132.4 ft to 132.5 ft NAVD 88 between Almaden Expressway overcrossing and Curtner Avenue overcrossing. The changes to the maximum 100-year WSE and extents of the flooded area were minimal at this location for Alternative 4 (Figure 4-15). The proposed top of rail elevation for Alternative 4 between Almaden Expressway overcrossing and Curtner Avenue overcrossing would remain unchanged from the existing condition. Because elevation of the local low point is lower than the maximum 100-year WSE, the overbank flood flow would overtop the proposed HSR track during the 100-year storm event.

The outputs from the proposed condition hydraulic analysis with floodwalls and equalizers culverts along proposed HSR track showed that seventeen 36-in. equalizer culverts would replicate the extents and elevation of the existing 100-year floodplain from the existing condition hydraulic model. The hydraulic analysis for Alternatives 1, 2, and 3 and Alternative 4 with floodwall and equalizer culvert showed no substantial changes to the WSE and extents of the 100-year floodplain.

4.5 Fisher Creek

4.5.1 Background Information

4.5.1.1 Floodplain Location

Fisher Creek is a tributary of Coyote Creek that flow northwest along western Coyote Valley and to the west of Coyote Creek. The creek changes flow direction from northwest to northeast approximately 1,000 feet upstream of the outfall to Coyote Creek.

4.5.1.2 FEMA Floodplain

According to the FEMA FIRM Panel No. 60685C0426H (FEMA 2009), the main channel of Fisher Creek in the project footprint is identified as Zone AE with a floodway (Figure 4-22). The width of the floodway measured along existing railroad bridge over Fisher Creek is approximately 120 feet.

4.5.1.3 Project Alternatives in the FEMA Floodplain

The project footprints for all project alternatives are in the existing 100-year floodplain for Fisher Creek.

Near the Fisher Creek crossing, Alternatives 1 and 3 would entail a viaduct section supported by pier columns placed in the median of Monterey Road. The viaduct section would cross Fisher Creek at approximately station 665+00. The width of the Zone AE floodplain and floodway measured along the centerline of the proposed track alignment for Alternatives 1 and 3 is approximately 150 feet. This alternative is also proposing to replace the existing Monterey Road bridge/culvert with 40 feet by 9.1 feet (width x height) wildlife crossing. There would be no changes to the existing railroad bridge over Fisher Creek.

Near the Fisher Creek crossing, Alternative 2 would use a new embankment section immediately west of Monterey Road. The existing railroad track paralleling Monterey Road on the west would be relocated farther west to accommodate two new HSR tracks. In addition, the project is proposing to replace the existing bridge/culvert below Monterey Road and existing railroad track with a 40-foot by 11-foot (width by height) wildlife crossing. The embankment section for Alternative 2 would cross Fisher Creek at approximately station 754+50.

Near the Fisher Creek crossing, Alternative 4 would share the existing two railroad tracks with Caltrain and UPRR. There would be no changes to the horizontal/vertical profile of the existing railroad track near Fisher Creek crossing. There would be no changes to the vertical/horizontal alignment of Monterey Highway near the Fisher Creek crossing. The existing bridge/culvert below Monterey Road and the existing railroad track would be replaced by a 40-foot by 11-foot (width × height) wildlife crossing. The wildlife crossing footprint for this alternative would be similar to Alternative 2. The existing railroad track for Alternative 4 would cross Fisher Creek at approximately station 704+00.

4.5.1.4 Available Hydraulic Model

The SCVWD hydraulic model was used to evaluate the potential project impacts on Fisher Creek floodplain, because FEMA did not provide the effective hydraulic model of Fisher Creek to the Authority. Figure 4-23, Figure 4-24, and Figure 4-25 shows the limits of the SCVWD hydraulic model and the project footprint for Alternatives 1 and 3, Alternative 2, and Alternative 4 at Fisher Creek, respectively.

Figure 4-25 Fisher Creek, Plan View of SCVWD Hydraulic Model with Project Footprint for Alternative 4

4.5.2 SCVWD Hydraulic Model

4.5.2.1 Overview of Hydraulic Model

The upstream and downstream limits of Fisher Creek included in the hydraulic model were immediately downstream of Old Monterey Road in the City of Morgan Hill (approximately 43,880 feet upstream of existing Monterey Road bridge) and confluence with Coyote Creek (approximately 170 feet downstream of existing Monterey Road bridge).

The two-dimensional mesh included in the SCVWD model covered areas west of Monterey Highway. The area of the two-dimensional mesh included in the hydraulic model is approximately 4,926 acres.

The downstream control WSE in the HEC-RAS hydraulic model of Fisher Creek was modified because the input parameters in the SCVWD's hydraulic model were lower than the 100-year WSE shown in the FEMA FIRM for Santa Clara County and Incorporated Areas (FEMA 2014). The downstream control for the hydraulic model was adjusted to 249 feet NAVD 88 to match the FEMA 100-year flood elevation shown in the FEMA FIRM. Because timing of the peak 100-year flood flow relative to the peak 100-year flood flow was not available, the downstream control WSE was set to be 249 feet from beginning to end of the hydraulic analysis.

The extents of the two-dimensional mesh in the base hydraulic model did not cover Monterey Highway. Therefore, the proposed pier columns on median of Monterey Highway were outside of the limits of the hydraulic model and was not included in the proposed condition hydraulic analysis of Alternative 1 and 3. Similarly, detailed grading for Alternatives 2 and 4 were not available. Therefore, the proposed condition hydraulic analysis for Alternatives 2 and 4 did not make adjustments to the ground elevation for the two-dimensional mesh. Because footprint of the wildlife crossing shown in the plans for Alternatives 2 and 4 was identical, the proposed condition hydraulic analysis for these two alternatives were performed using the same hydraulic model. This will be revised in the next phase, when the detailed design is available to differentiate Alternatives 2 and 4.

4.5.2.2 Inflow Hydrograph for Hydraulic Analysis

The hydraulic model of Fisher Creek included hydrograph of Fisher Creek and its tributaries during the 100-year storm event. There were 14 locations in the hydraulic model with assigned inflows. Ten inflow locations are assigned as direct inflow into channel cross section, and four remain inflow locations are assigned as surface runoff flowing from the upstream limit of the two-dimensional mesh assigned in the hydraulic model. The peak 100-year flows at each inflow location are summarized in Table 4-9. The inflow locations in the hydraulic model are shown in

4.5.2.3 Water Surface Elevations

The modeling results for Alternatives 1 and 3 and Alternatives 2 and 4 are shown in Table 4-10 and Table 4-11, respectively. The outputs from the hydraulic analysis showed that the proposed wildlife crossing proposed for Monterey Road Bridge (all alternatives) and the railroad bridge (Alternatives 2 and 4) would lower the 100-year flood profile of Fisher Creek main channel upstream of the project location.

Table 4-10 Hydraulic Modeling Results, Fisher Creek, Alternatives 1 and 3

Location	Flow Rate (cfs)	Channel Bank Elevation (feet NAVD 88)	WSE—Existing Condition (feet NAVD 88)	WSE—Proposed Condition (feet NAVD 88)	Change in WSE (feet)

WSE = water surface elevation
HSR = high=speed rail

4.5.2.4 Overbank Flood Flow

The modeling results for the two-dimensional floodplain analysis for Fisher Creek in the project vicinity are shown in Figure 4-23 for existing condition, Figure 4-24 for Alternatives 1 and 3, and Figure 4-25 for Alternatives 2 and 4. The outputs from the proposed condition hydraulic analysis showed that the proposed wildlife crossing/cross culvert with a larger flow opening that would lower the 100-year flood profile of mainline Fisher Creek would also reduce the extents of the 100-year floodplain by in the project vicinity.

4.6 Uvas-Carnadero Creek

4.6.1 Background Information

4.6.1.1 Floodplain Location

Uvas-Carnadero Creek originates in the Santa Cruz Mountains, and it has a watershed size of approximately 87 square miles. Uvas Creek drains the southern slope of Loma Prieta, where the Uvas-Carnadero Creek watershed abuts the Los Gatos Creek, Alamitos Creek, and Llagas Creek watersheds. Uvas Creek generally flows in a southeasterly direction through the Santa Cruz Mountains towards Gilroy. Near the US 101, Uvas Creek changes its name to Carnadero Creek; therefore, this system is commonly referred to as Uvas-Carnadero Creek. Carnadero Creek discharges into Pajaro River just upstream of the Pajaro Narrows (SCVWD 2012b).

4.6.1.2 FEMA Floodplain

According to the FEMA FIRM panel numbers 06085C0752H, 06085C0756H, 06085C0760H (FEMA 2009), and FEMA LOMR Case No. 16-09-2429P, the FEMA SFHAs for Uvas-Carnadero Creek and overbank flood flows in the project footprint for are Zones A, AH, AO, and AE. FEMA LOMR Case No. 16-09-2429P became effective in January 8, 2018 revised the 100-year flood profile of mainline Uvas-Carnadero Creek between US 101 and Bloomfield Avenue and at the overbank area bounded by Uvas-Carnadero Creek on north, by Bloomfield Avenue on south and east, and by the railroad track on west. The remaining floodplains are effective since 2009.

There are no designated floodways in the Uvas-Carnadero Creek floodplain in the project footprint. The 100-year WSEs of Uvas-Carnadero Creek and overbank flood flows in the project footprint vary from approximately 195 feet NAVD in the City of Gilroy (Alternatives 1, 2, and 4) to approximately 166 feet NAVD 88 at the Bloomfield Avenue Bridge (Alternatives 1 and 2) and the overbank areas (Alternative 4).

Uvas-Carnadero Creek in the project footprint is recognized as a FEMA 100-year floodplain. Therefore, the project cannot raise the flood profile of Uvas-Carnadero Creek by more than 1.0 foot.

4.6.1.3 Project Alternatives in the FEMA Floodplain

The project footprints for Alternatives 1 and 2 include the Bloomfield Avenue Bridge over Uvas-Carnadero Creek (Figure 4-30). These two alternatives would replace the existing Bloomfield Avenue Bridge with a taller bridge to cross over the proposed maintenance facility. The project footprints for Alternatives 1 and 2 are also within the limits of the 100-year floodplain of the overbank flood flow of Uvas-Carnadero Creek. Alternative 1 is proposing a viaduct segment and maintenance facility in the exiting FEMA 100-year floodplain. Alternative 2 is proposing embankments, a trench section with lid, and a maintenance facility in the exiting FEMA 100-year floodplain.

The project footprint for Alternative 4 does not cross Uvas-Carnadero Creek, but is within the limits of the 100-year floodplain of the overbank flood flow of Uvas-Carnadero Creek (Figure 4-31). Alternative 4 is proposing embankments and a maintenance facility in the exiting FEMA 100-year floodplain.

The project footprint for Alternative 3 is outside the limits of the 100-year floodplain of Uvas-Carnadero Creek, excluding the Soap Lake floodplain area.

4.6.1.4 Available Hydraulic Model

The FEMA effective hydraulic model and hydraulic model provided by SCVWD were available for this waterbody.

The SCVWD hydraulic model was used to develop combined one- and two-dimensional hydraulic model of the Soap Lake floodplain, discussed in detail in Chapter 5, Combined One- and Two-Dimensional Hydraulic Modeling for Soap Lake floodplain. Therefore, the outputs from this hydraulic model would not be discussed further in this section of this study.

This section addresses the project's potential impacts on the mainline Uvas-Carnadero Creek floodplain using the FEMA effective hydraulic model of Uvas-Carnadero Creek. The project's potential impacts on the overbank flood flows of Uvas-Carnadero Creek in the project footprint are discussed in Chapter 5.

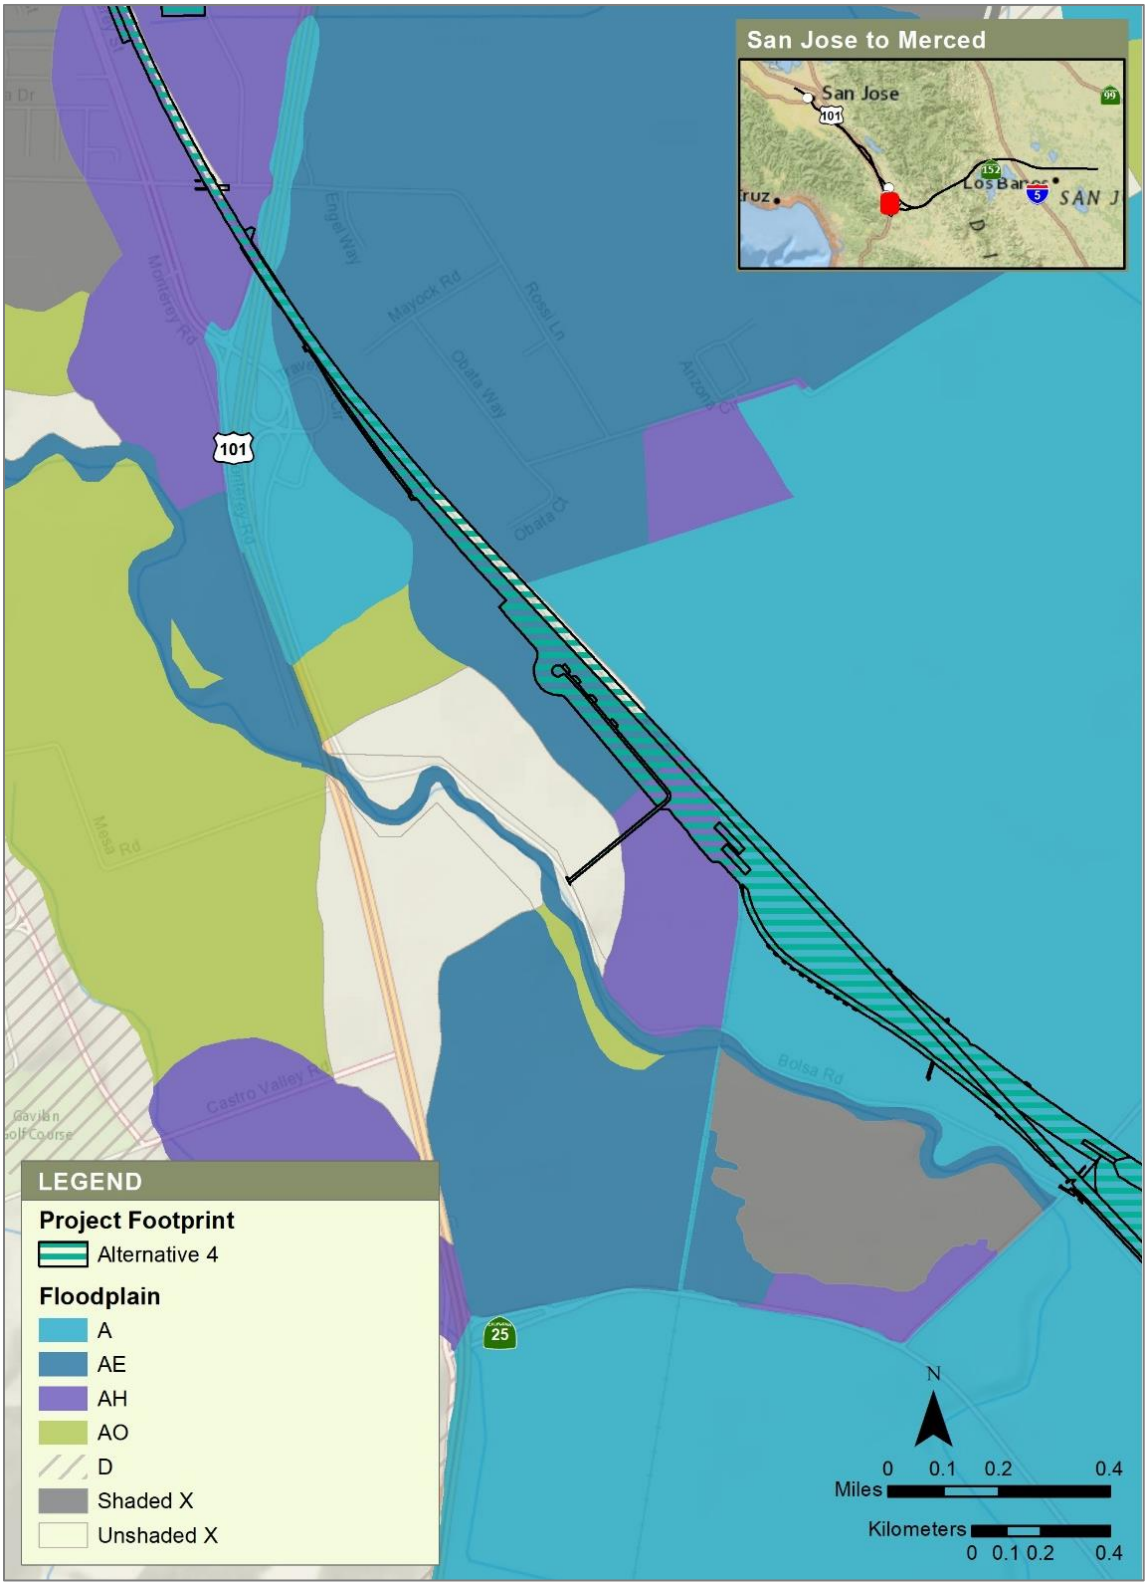
JANUARY 2019

Figure 4-30 FEMA FIRM, Uvas-Carnadero Creek at Project Location with Project Footprints for Alternatives 1 and 2



Sources: FEMA 2009; Authority 2019

JANUARY 2019

Figure 4-31 FEMA FIRM, Uvas-Carnadero Creek at Project Location with Project Footprint for Alternative 4

4.6.2 FEMA Hydraulic Model

The upstream and downstream limits of Uvas-Carnadero Creek representing the one-dimensional component of the hydraulic model is at Santa Teresa Blvd (approximately 33,100 feet upstream of the existing Bloomfield Avenue Bridge) and approximately 1,700 feet downstream of the existing Bloomfield Avenue Bridge. The two-dimensional surface area is assigned on the overbanks between the downstream limit of the hydraulic model and West Luchessa Avenue bridge (approximately 21,900 feet upstream of Bloomfield Avenue Bridge). The area of the two-dimensional surface included in the hydraulic model is approximately 4,820 acres.

The hydraulic analysis of the existing condition was performed without making any changes to the base hydraulic model. The proposed condition hydraulic model for Alternatives 1 and 2 removed and replaced the existing Bloomfield Avenue Bridge over Uvas-Carnadero Creek. The hydraulic analysis for Alternatives 3 and 4 were not performed because the project footprint for these two alternatives were outside of the main channel of Uvas-Carnadero Creek.

4.6.2.1 Inflow Hydrograph for Hydraulic Analysis

The hydraulic model of Uvas-Carnadero Creek included hydrographs of Uvas-Carnadero Creek during 100-year storm event. There were 3 locations in the hydraulic model with assigned inflows, all assigned as direct inflow into the creek main channel. The peak 100-year flows at each inflow location are summarized in Table 4-10. The inflow locations in the hydraulic model are shown in Figure 4-28.

Table 4-12 Peak 100-Year Inflows into Los Gatos Creek Hydraulic Model

Location	Distance from Existing Bloomfield Avenue Bridge[1]	Peak Inflow (cfs)
RS 32605	33,300 feet upstream	13,480

5 COMBINED ONE- AND TWO-DIMENSIONAL HYDRAULIC MODELING FOR SOAP LAKE FLOODPLAIN

5.1 General Information

The Soap Lake floodplain lies along the Pajaro River in San Benito and Santa Clara Counties between SR 152 and US 101. The approximate footprint of the Soap Lake floodplain is illustrated on Figure 5-1. Soap Lake is a natural detention basin storing water and reducing peak flows that would otherwise increase flooding in the lower Pajaro River in San Benito, Santa Cruz, and Monterey Counties. The major waterbodies contributing to the Soap Lake floodplain are Uvas-Carnadero Creek, Llagas Creek, Tequisquita Slough, and Pacheco Creek.

Soap Lake is a very important flood management feature for downstream areas because flood storage and attenuation in Soap Lake leads to a substantial decrease in peak flows downstream. According to the PRWFPA's *Pajaro River Watershed Study Final Phase 3 and 4a Report*, the outputs from the HEC-1 hydrologic model for Pajaro River watershed with and without Soap Lake showed substantial decreases in the peak flood flows at Chittenden stream gage, approximately 5 miles downstream of the Soap Lake outlet (PRWFPA 2005) (Table 5-1 and Figure 5-2).

The preliminary findings from the combined one- and two-dimensional hydraulic analysis were presented to the PRWFPA on December 21, 2016. The approach of the HSR to crossing the Soap Lake floodplain is to minimize potential changes to the WSEs, horizontal extent, and peak flows for the 100-year storm event.

5.2 Existing Floodplain Mapping in Soap Lake Floodplain

The Soap Lake floodplain is located in the FEMA FIRMs 06085C0756H, 06085C0757H, 06085C0760H, 06085C0770H, and 06085C0780H in Santa Clara County and the FEMA FIRMs 06069C0045D, 06069C0050D, and 06069C0075D in San Benito County.

The FEMA FIRMs in Santa Clara County classify the Soap Lake floodplain and its vicinity as Special Flood Hazard Area Zones A, AE, AH, and AO. The FEMA FIRMs in San Benito County indicate that the Soap Lake floodplain and its vicinity are classified as Special Flood Hazard Area Zone A. The FEMA Special Flood Hazard Area Zones near the Soap Lake floodplain are illustrated on Figure 5-3.

Zone A represents areas subject to flooding by the 100-year flood event determined by approximate methods where BFEs are not shown. Because detailed analyses are not performed for such areas, BFEs and flood depths have not been determined by FEMA for the floodplains in the Soap Lake floodplain and vicinity. A majority of the Soap Lake floodplain is designated as Zone A.

Zone AE represents areas subject to flooding by the 100-year flood event determined by detailed methods. The FIRM shows BFEs in this 100-year flood zone. The mainline of Uvas-Carnadero Creek, Llagas Creek, Llagas Overbank Flow, and overbank spill flows from Uvas-Carnadero Creek, and Pajaro River at the Soap Lake outlet are designated as Zone AE near the Soap Lake floodplain.

Zone AH represents areas subject to flooding by the 100-year flood event where average depths are between 1 and 3 feet. Zone AH typically represents areas of shallow ponding during the 100-year flood event. The FIRM shows BFEs derived from detailed hydraulic analyses in this 100-year flood zone. The portions of the overbank spill flows from Uvas-Carnadero Creek are designated as Zone AH near the Soap Lake floodplain.

Zone AO represents areas subject to flooding by the 100-year flood event where average depths are between 1 and 3 feet. Zone AO typically represents areas with shallow sheet flow on sloping terrain during the 100-year flood event. The average flood depths from detailed hydraulic analyses are shown in this 100-year flood zone. The portions of the overbank spill flows from Uvas-Carnadero Creek and portions of the overbank spill flows from Jones Creek are designated as Zone AO near the Soap Lake floodplain.

5.3 Background Information

The hydrologic and hydraulic analyses of the Soap Lake floodplain were performed by combining the information available from the previous studies performed in its vicinity. Table 5-2 shows the list of resources obtained for the hydrologic and hydraulic analyses.

Table 5-2 Resources Obtained for Hydrologic and Hydraulic Analysis

Agency	Obtained Resource	Date
Federal Emergency Management Agency	Flood Insurance Study for Santa Clara County and Incorporated Areas	Published February 14, 2014
Pajaro River Watershed Flood Prevention Authority	One-dimensional hydraulic model of Soap Lake floodplain This model was used in the *Pajaro River Watershed Study, Final Phase 3 and 4a Report*, published February 2005	Received June 26, 2016
Santa Clara Valley Water District	Combined one- and two-dimensional hydraulic model of Uvas-Carnadero Creek One-dimensional hydraulic model of Llagas Creek and West Branch Llagas Creek	Received June 3, 2016
	One-dimensional hydraulic model of Llagas Creek and Tributaries and Hydrologic Analysis of Llagas Creek Watershed	Received January 5, 2018
Schaaf & Wheeler	Hydrologic model of Pajaro River Watershed This model was used in *Technical Memorandum No. 1.2.7* for the PRWFPA's *Pajaro River Watershed Study* (2001)	Received June 30, 2016
Towill, Inc.	One- and three-feet grid LiDAR digital elevation map of Soap Lake floodplain	Received January 6, 2017

PRWFPA = Pajaro River Watershed Flood Prevention Authority

5.4 Hydrologic Data Sources

This section describes the hydrologic data sources that were used to develop the inflow hydrographs into the Soap Lake floodplain model. Analysts reviewed the available hydrologic data from the FEMA FIS, hydraulic models provided by the SCVWD and PRWFPA, and the hydrologic model provided by Schaaf and Wheeler on behalf of PRWFPA.

5.4.1 Available 100-Year Flows

The FEMA FIS for Santa Clara County and Incorporated Areas, last revised on February 14, 2014, provided the peak 100-year flow of Uvas-Carnadero Creek, Llagas Creek, and the Pajaro River. The FEMA FIS for San Benito County and Incorporated Areas, last revised on April 16, 2009, did not provide peak flows of waterbodies near the Soap Lake floodplain.

The hydraulic model for Uvas-Carnadero Creek provided by the SCVWD included the 100-year, 60-hour hydrograph used in the unsteady-state hydraulic analysis. The hydraulic model for Llagas Creek provided by the SCVWD included the peak 100-year flows used in the steady-state hydraulic analysis. SCVWD also provided hydrologic analysis of Llagas Creek, which included peak flow of Llagas Creek with no overbank flood flows in upstream of Soap Lake (SCVWD 2018g).

The one-dimensional hydraulic model of Soap Lake floodplain provided by PRWFPA included the peak 100-year flows of Uvas-Carnadero Creek, Llagas Creek, and Uvas Creek.

On behalf of PRWFPA, Schaaf & Wheeler provided the outputs of the HEC-1 hydrologic model used in *Technical Memorandum No. 1.2.7* for the PRWFPA's *Pajaro River Watershed Study* (2001). The memorandum provided the layout of the subwatersheds in the HEC-1 hydrologic

model (Figure 5-4 and Table 5-3). The outputs from HEC-1 hydrologic model included peak flows at each subwatershed in the hydrologic model.

The obtained peak flows of the waterbodies entering the Soap Lake floodplain from FEMA, SCVWD, and Schaaf and Wheeler are shown in Table 5-4.

5.4.2 Inflow Hydrographs for Hydraulic Analysis

The peak 100-year flow of Uvas-Carnadero Creek from the SCVWD model was the most conservative among the four data sources and was used for the hydraulic analysis of the Soap Lake floodplain. The timing of the peak 100-year flow (17,000 cfs, Table 5-4) was assumed same as the timing of the peak 100-year flow of Uvas-Carnadero Creek from HEC-1 hydrologic model (Figure 5-5). Figure 5-6 shows comparison of the 100-year flow hydrograph of Uvas-Carnadero Creek from SCVWD and HEC-1 hydrologic model.

The peak 100-year flows of Llagas Creek from the HEC-1 hydrologic model is from a study performed in 2001. According to SCVWD, the peak 100-year flow of Llagas Creek included in the SCVWD was based on the USACE's *Upper Llagas Creek Flood Control Project Existing Conditions Floodplains Study* dated September 2006. The FEMA FIS for Santa Clara County dated February 14, 2014, provided the peak 100-year flow of Llagas Creek just upstream of the Soap Lake floodplain. The peak flow rates for Llagas Creek have not been revised from the FEMA FIS for Santa Clara County dated August 17, 1998.

The peak 100-year flows from the FEMA FIS were most conservative among the available 100-year peak flows (Table 5-4). However, the FEMA FIS flows are oldest among the three types of available data, and the FEMA FIS did not provide peak flows of Llagas Creek immediately downstream of confluence with West Branch Llagas Creek. Because sufficient data were not available from the FEMA FIS for the tributary of Llagas Creek, the peak flow of 17,800 cfs from the SCVWD's watershed assessment (SCVWD 2018g) of Llagas Creek was selected as the inflow for the hydraulic analysis of the Soap Lake floodplain. Because SCVWD watershed assessment only provided the peak flow, the hydrograph of Llagas Creek downstream of the confluence with West Little Llagas Creek were assumed to be following the same flooding pattern as the hydrograph of Llagas Creek from the HEC-1 hydrologic model. The hydrograph Llagas Creek were determined by multiplying the hydrograph by the ratio of peak flows between HEC-1 hydrologic model and the SCVWD design flood flows. The timing of the peak flood flow was assumed to remain unchanged from the HEC-1 hydrologic model. Figure 5-7 shows comparison of the 100-year flow hydrographs of Llagas Creek from SCVWD and 100-year flow hydrograph of Llagas Creek from HEC-1 hydrologic model.

For the remaining waterbodies (Jones Creek, unnamed waterbodies, Tequisquita Slough, and Pacheco Creek), the output from the HEC-1 hydrologic model was the only source of the peak flows and was used for the hydraulic analysis of the Soap Lake floodplain.

Subwatershed PJ-2 from the HEC-1 hydrologic model represents the unnamed waterbodies outfalling to Soap Lake, downstream of the confluence of PJ-1 and Pacheco Creek. In addition, PJ-2 represents the storm runoff entering the Soap Lake floodplain flowing from the north and south of this reach, as illustrated on Figure 5-4. Therefore, the hydrograph for PJ-2 in the Soap Lake floodplain model was evenly divided into PJ-2 north and PJ-2 south, based on the watershed area north and south of the Soap Lake to separate out the incoming flows from north and south of the Soap Lake floodplain.

The inflow hydrographs used in the hydraulic analyses are illustrated on Figure 5-8. The begin and end times of the simulation were set to match with the duration of the 60-hr hydrograph of Uvas-Carnadero Creek from SCVWD, adjusted to match with the peak flood of Uvas-Carnadero Creek from the HEC-1 hydrologic model as illustrated on Figure 5-6. To provide stability in the hydraulic model simulation, the inflows at the beginning of the simulations were assumed to be 1 cfs for all of the subwatersheds of the Soap Lake floodplain included in the Soap Lake floodplain model, and was set to match with the inflows from selected hydrographs at hour 2. In addition, the inflow of 5 cfs was assumed to flow into Millers Canal in the first 10 hours of the model simulation to avoid the dry channel before receiving the inflows from Tequisquita Slough, Pacheco Creek, Subwatershed PJ-1, and Subwatershed PJ-2 (south).

The inflow hydrograph for the hydraulic analysis of Soap Lake floodplain are illustrated on Figure 5-8. The peak 100-year flows from the hydrographs assigned to the Soap Lake floodplain model are summarized in Table 5-5.

Table 5-5 Peak 100-Year Flows from the Hydrographs for Soap Lake Floodplain Model

Waterbody Name	Peak 100-year Flow (cfs)	Source
Uvas-Carnadero Creek	17,000	SCVWD 2016
Llagas Creek (downstream of confluence with West Branch Llagas Creek)	17,800	SCVWD 2018
Tequisquita Slough	10,409	*Schaaf and Wheeler 2001*
Pacheco Creek	13,408	*Schaaf and Wheeler 2001*
Subwatershed PJ-1	2,125	*Schaaf and Wheeler 2001*
Subwatershed PJ-2 (north)	3,122	*Schaaf and Wheeler 2001*
Subwatershed PJ-2 (south)	3,122	*Schaaf and Wheeler 2001*

5.5 Hydraulic Analysis

5.5.1 Overview of Hydraulic Analysis

Innovyze's Infoworks ICM software was used to perform the combined one- and two-dimensional hydraulic analysis of the Soap Lake floodplain. ICM is an integrated one-dimensional and two-dimensional hydrodynamic simulation, incorporating both above- and below-ground elements of catchments. This software was chosen because of its ability to combine one-dimensional open channel flows and a full two-dimensional mesh solution for the floodplain flows.

The ICM hydraulic model for the Soap Lake floodplain is composed of a one-dimensional riverine model, two-dimensional floodplain model, inflow hydrographs assigned into the one- and two-dimensional components of the hydraulic model, and geometric features assigned in the model to represent the proposed HSR structures. The following sections describe each of the components in the ICM hydraulic model for the Soap Lake floodplain.

5.5.2 One-Dimensional Riverine Model

The ICM hydraulic model for the Soap Lake floodplain included one-dimensional riverine models of Uvas-Carnadero Creek, Llagas Creek, Pajaro River, Millers Canal, Tequisquita Slough, and Pacheco Creek. Figure 5-6 illustrates the location, alignment, and limits of the one-dimensional riverine models included in the ICM hydraulic model.

The hydraulic model of Uvas-Carnadero Creek, Llagas Creek, and Lower Llagas Creek provided by the SCVWD and the hydraulic model of the Soap Lake floodplain provided by PRWFPA were imported into the ICM hydraulic model to use as the one-dimensional riverine component of the model.

The channel cross sections for Uvas-Carnadero Creek and Llagas Creek overlapped between the SCVWD model and the PRWFPA' Soap Lake floodplain model. Because the hydraulic model prepared by SCVWD was more recent than the Soap Lake floodplain model provided by PRWFPA, the channel cross sections included in the SCVWD hydraulic model were used in the combined one- and two-dimensional hydraulic model for locations with overlap. The input parameters in the SCVWD's hydraulic model, such as channel cross sections, distance between cross sections, Manning's roughness coefficients assigned to each cross section, and bridge dimensions, remained unchanged from the original model in general.

The Soap Lake floodplain used in the *Pajaro River Watershed Study, Final Phase 3 and 4a Report* published in February 2005 included Uvas-Carnadero Creek, Llagas Creek, Pajaro River, and Millers Canal. Because the footprint of this one-dimensional hydraulic model included the overbank areas that would be represented using the two-dimensional mesh in the ICM hydraulic model, the limits of the one-dimensional model were trimmed to include only the main channel of the riverine model. The remaining model attributes from the one-dimensional riverine model were unchanged when they were imported to the ICM hydraulic model.

Within the limits of the Soap Lake Hydraulic Model, there are three confluences of the one-dimensional riverine components: Llagas Creek and Pajaro River, Pajaro River and Millers Canal, and Pajaro River and Uvas-Carnadero Creek. The channel cross sections cut from the terrain files were added to the river reaches at the junctions to improve the accuracy of the hydraulic model.

There were no hydraulic models available for Tequisquita Slough and Pacheco Creek near the Soap Lake floodplain. The riverine models for these two creeks were added into the ICM model using the digital elevation model (DEM) file of Soap Lake floodplain provided by Towill on January 6, 2017.

Tequisquita Slough in the Soap Lake floodplain model is set to outfall into the two-dimensional floodplain model, instead of outfalling into the river reach of Pacheco Creek. Similarly, the upstream limit of Pacheco Creek in the Soap Lake floodplain is set to receive the overland spill flow from the two-dimensional floodplain, instead of assigning the inflow hydrographs at the upstream limit of the one-dimensional riverine model. The one-dimensional and two-dimensional

model connections at the upstream or downstream limits of the riverine model for Tequisquita Slough and Pacheco Creek in the Soap Lake floodplain model were assigned, because the terrain file used in the Soap Lake floodplain model does not show a defined floodplain channel beyond the limits of the riverine model. Therefore, based on the current available info, terminating the one-dimensional riverine model in the middle of the two-dimensional floodplain would best represent the flood flows in Pacheco Creek and Tequisquita Slough in the Soap Lake floodplain model. When a detailed survey is available during the design phase of this project, the riverine model limits may be revised if the new survey shows a defined channel.

The riverine models that correspond to Subwatersheds PJ-1, PJ-2, and PJ-3 from the HEC-1 model were not included in the ICM hydraulic model because there was not sufficient information available to determine the geometry of the floodplains corresponding to the Subwatersheds PJ-1, PJ-2, and PJ-3 (except for Jones Creek which is part of the PJ-2 watershed coming from north). The inflow for Subwatershed PJ-3 was represented as inflows into the Pajaro River between the confluences with Llagas Creek and Millers Canal. The inflows for Subwatersheds PJ-1 and PJ-2 were represented as floodplain sheet flows in the two-dimensional floodplain model. The setup of the inflows entering the Soap Lake Floodplain may be revised during the design phase of this project if the revised watershed study becomes available.

The other floodplains, including the irrigation canals and unnamed streams were not represented using the one-dimensional riverine model, because unlike Tequisquita Slough and Pacheco Creek, these floodplains did not have available hydrologic information. In addition, a detailed drainage design to cover the small systems in the project footprint was not available to incorporate into the Soap Lake floodplain model. Therefore, potential flood flows inside the unnamed floodplains and irrigation canals were represented as floodplain sheet flow in the two-dimensional hydraulic component of the Soap Lake floodplain model, discussed in detail in the following section. The setup of the other floodplains in the limits of the Soap Lake Floodplain may be revised during the design phase of this project if the revised watershed study and hydrologic analysis become available.

5.5.3 Two-Dimensional Floodplain Model

The two-dimensional floodplain component of the ICM hydraulic model was created by combining the terrain files of Santa Clara County included in the SCVWD's combined one- and two-dimensional hydraulic model of Uvas-Carnadero Creek and the DEM file of Soap Lake floodplain provided by Towill on January 6, 2017. Figure 5-9 illustrates the limits of the combined terrain file. At the locations covered by both terrain files, the terrain data from Towill was selected because it was taken more recently and had higher resolution. The two DEM files were merged using ESRI ArcMAP software, and the Focal Statistics Tool in ESRI ArcMAP was used to fill in the data gaps that were found in the combined terrain file. Figure 5-10 illustrates the limits of the ICM model and the extents of the two terrain files combined into the single terrain file. In general, areas around the Santa Clara/San Benito County line and in San Benito County reference the Towill terrain file. The areas farther north reference the SCVWD terrain file.

The ground elevation in the limits of the ICM model varies from approximately 120 feet NAVD 88 at the Soap Lake outlet to approximately 200 feet NAVD 88 at the northern and northeastern model limits. The total area in the hydraulic model is approximately 26,300 acres.

The two-dimensional floodplain components of the ICM hydraulic model are represented by meshes with elevations based on the terrain file. The range of the mesh size selected for the hydraulic model is summarized in Table 5-6. The mesh size for a flat, uniform floodplain surface was represented in a larger mesh size. The locations with a rapid change in ground elevation, such as irrigation ditches and unnamed waterbodies and embankments for roadways, are represented using a finer mesh size. Equalizers on the proposed embankment section were 10 feet wide in the Soap Lake floodplain model and were represented using finer mesh close to the size of the grid size of the terrain file.

Table 5-6 Mesh Sizes Selected for Soap Lake Floodplain Model

Terrain Type	Range of Mesh Size (square feet)
General floodplain area	100 to 7,500
City of Gilroy, upstream/downstream of equalizers, proposed diches along embankment, and misc. floodplain areas requiring finer mesh size	100 to 500
Equalizers (for proposed condition only)	25 to 150

The two-dimensional floodplain model and one-dimensional riverine model for the Soap Lake Floodplain are connected using the bank flow connections, which enable overbank flood flow to leave and re-enter between the two modeling components.

The SCVWD's combined one- and two-dimensional hydraulic model of Uvas-Carnadero Creek used Manning's roughness coefficient of 0.060 to represent the floodplain areas in Santa Clara County. The Soap Lake floodplain model also used the same Manning's roughness coefficient for the entire two-dimensional floodplain component of the ICM hydraulic model, except at the equalizers below the proposed embankment for the project alternatives and relocated channel for Jones Creek for Alternative 3. The Manning's roughness coefficients for the two-dimensional floodplain model would be revised during the design phase of this project to account for the land uses within the limits of the hydraulic model.

5.5.4 Inflow Hydrograph

The inflow hydrographs selected for the hydraulic analysis of the Soap Lake Floodplain are discussed in Section 5.4, Hydrologic Data Sources.

The locations of the inflow hydrographs in the ICM hydraulic model are illustrated on Figure 5-11. The inflow hydrographs for Uvas-Carnadero Creek, Llagas Creek, Tequisquita Slough, and Pacheco Creek were assigned at the upstream limit of the riverine 1-D model.

Because inflows from Subwatersheds PJ-1, PJ-2 north, PJ-2 south, and PJ-3 are for unnamed streams, and there are no riverine models associated with those flows, the inflow hydrographs were treated as the floodplain sheet flow entering the limits of the ICM floodplain model.

Subwatershed PJ-1 represents the unnamed waterbodies outfalling to Pacheco Creek between the confluence of Tequisquita Slough and San Felipe Lake in the HEC-1 hydrologic model. PJ-1 was represented in the Soap Lake floodplain model as a floodplain sheet flow entering the limits of the model on upstream of San Felipe Lake to best represent the location of this subwatershed in the HEC-1 hydrologic model.

Subwatershed PJ-2 north was assigned to replicate the FEMA 100-year floodplain sheet flowing incoming from north on east of Llagas Creek, which also included Jones Creek. The extents of the floodplain sheet flow inflow for PJ-2 north at the model boundary was assigned to match with the extents of the FEMA 100-year floodplain.

Subwatershed PJ-2 south was assigned to represent the unnamed waterbodies flowing from the south of the Soap Lake. The extents of the floodplain sheet flow for PJ-2 south was selected at the location at the local low point east of Frazier Lake Road to match with the watershed delineation illustrated on Figure 5-4.

Subwatershed PJ-3 represents the unnamed waterbodies outfalling Soap Lake between San Felipe Lake and the confluence of Uvas-Carnadero Creek and Pajaro River in the HEC-1 hydrologic model. The inflow hydrograph for PJ-3 in the Soap Lake Floodplain was assigned at the confluence of Pajaro River and Llagas Creek to best represent the location of PJ-3 in the HEC-1 hydrologic model.

5.5.5 HSR Structures and Assumptions in the Hydraulic Model

5.5.5.1 Model Setup

Within the limits of the Soap Lake floodplain model, there are existing storm drain systems and existing cross-drainage structures that are not represented in the one-dimensional riverine model. Because information related to these underground systems and cross drainage information was not readily available, this information was not included in the Soap Lake floodplain model to compare the existing and proposed conditions.

Infoworks ICM can assign rainfall and groundwater infiltration directly to the two-dimensional floodplain. The groundwater infiltration was not assigned in the hydraulic model, because it was assumed that the areas within the limits of the Soap Lake floodplain model are fully saturated during the design 100-year storm event. The direct rainfall onto the two-dimensional floodplain was not included in the hydraulic analysis, because it would double-count the flood flow for the Subwatershed PJ-3, which includes limits of the Soap Lake floodplain model.

The inflow for the first two hours of the simulation was set lower than the values from the hydrograph, and an additional inflow of 5 cfs was assigned to Millers Canal at the first 10 hours of the simulation to provide model stability. Because assigned flow rates of 1 cfs and 5 cfs are small in comparison to the peak 100-year flows of the inflows into the Soap Lake Floodplain and are only assigned at the timesteps before the peak 100-year flood, flows from incoming watersheds enter into the Soap Lake floodplain model. Therefore, it was assumed that the inflows assigned to Millers Canal would not have an influence to the extents and depth of the 100-year floodplain within the limits of the Soap Lake Floodplain model.

A void area is assigned in the two-dimensional mesh at the river reach junctions in the ICM model to prevent the double-counting of the floodplain storage volume in the one-dimensional riverine model and the surface file in the two-dimensional floodplain model.

5.5.5.2 Proposed HSR Structures

The HSR structure types proposed near the Soap Lake floodplain are trench, embankment, and viaducts/bridges for Alternative 2, while the types for Alternatives 1, 3, and 4 consist of embankment and viaduct/bridges. The floodplain minimization measures proposed in the Soap Lake floodplain are equalizers, maximizing the length of the viaduct segment in the footprint of the Soap Lake floodplain, installing lids over the trench segment, and flood basins.

The trench segment proposed in the downtown Gilroy area under Alternative 2 would have floodwalls around the footprint of the trench segment to prevent the overland flood flow from entering the proposed HSR track. The floodwalls are represented in the ICM hydraulic model by assigning a void polygon in the footprint of the trench section with a floodwall, which would act as a wall in the hydraulic model. When undercrossing US 101 in the City of Gilroy, the proposed trench segment would be covered by lids, which would prevent the overland flood flow from entering the proposed HSR track. Within the limits of the segments covered by lids, it was assumed that the project would not modify the existing terrain and would maintain the existing flooding pattern and roughness of the overbank spill flow from Uvas-Carnadero Creek. This assumption is represented in the ICM hydraulic model by not changing the setup of the hydraulic model from the existing conditions within the limits of the trench section with lid.

The embankment portions under Alternatives 1, 2, and 4, as well as the segments under Alternative 3 within the limits of the Soap Lake floodplain model, were assumed elevated above the 100-year floodplain. This assumption was represented in the ICM hydraulic model by assigning void polygons in the footprint of the proposed embankment, which would remove the footprint of the embankment from the potential flooded areas within the limits of the ICM hydraulic model. The ditches along the embankment portion — that would be used for stormwater treatment — would convey runoff from low-intensity storm events and dissipate the energy from the flows concentrated inside the equalizers. These ditches were assumed to be approximately 15 feet wide in the hydraulic model. As discussed in Section 5.5.3, Two-Dimensional Floodplain Model, ditches along the HSR right-of-way were represented in the Soap Lake floodplain model

using a finer resolution than the general floodplain area within the limits of the Soap Lake floodplain model.

The viaduct/bridge portions were represented in the ICM hydraulic model by placing 15-foot-wide square piers every 100–120 feet, as shown in the draft plans. The span widths were modified at the bridge crossings where pier locations were included in the CADD file for the proposed alignment. The location and size of the piers included in the Soap Lake floodplain model would be revised during the design phase of this project when the design of the span length and pier type selections are finalized.

The maintenance facilities proposed under the downtown Gilroy (Alternatives 1, 2, and 4) and east Gilroy (Alternative 4) scenarios were modeled the same way as the embankments, but with a wider footprint. The footprint of the proposed maintenance facility was represented as a void space in the Soap Lake floodplain model.

The equalizers for these three project alternatives were assumed to have an opening width of 10 feet for every 100 feet in the hydraulic model. The equalizers in the hydraulic model were represented as openings below the embankment section to help maintain the existing shallow overland floodplain flow within the limits of the Soap Lake floodplain model. Because a detailed design of the equalizers is not available at this phase of the project, they were represented using narrow overland flow with Manning's n value of 0.015 below the embankment section. Sluice gate with opening height of 3 feet was assigned at the upstream and downstream ends of the 10-foot-wide opening area to control the inflows/outflows into the areas assigned as equalizers. The Manning's n value was set lower than the 0.060 used as the general value for the entire floodplain, because equalizers would have a smoother surface than the overall landscape within the limits of the Soap Lake floodplain model. The flowline elevations of the equalizers were assumed to be generally at grade. The flowline elevations of the equalizers were set below-grade at the locations when additional discharge capacity was required to prevent substantial increases to the 100-year floodplain elevation local to the upstream face of the equalizers.

The flood basins located near the footprint of the proposed maintenance facilities were assumed to have depths of 3–4 feet below the original grade. The drainage features, such as culverts with flap gates to release the flood flow from the proposed basins, were not included in the hydraulic model.

Alternative 3 is proposing realignment of Jones Creek. Because a detailed design of the creek realignment was not provided, a realigned Jones Creek in the Soap Lake floodplain model for Alternative 3 is represented by lowering the terrain by approximately 3 feet, and the width of the realigned channel with lowered terrain was set to convey the peak 100-year flow from Subwatershed PJ-2 north when combined with the equalizers assigned below the footprint of the maintenance facility. The design of the realigned Jones Creek in the Soap Lake floodplain model will be refined in the design phase of this project.

5.5.6 Modeled Alternatives

The hydraulic analyses of the Soap Lake floodplain were performed for the following five conditions:

- Existing Condition
- Alternative 1 —With minimization measures and impact avoidance and minimization features (IAMF)
- Alternative 2 — With minimization measures and IAMFs
- Alternative 3 — With minimization measures and IAMFs
- Alternative 4 — With minimization measures and IAMFs

The area of the embankments in the FEMA 100-year floodplain, lengths of viaduct, number of equalizers, and area of the flood basins for each alternative are shown in Table 5-7.

Table 5-7 HSR Structures in the Soap Lake Floodplain Model

HSR Proposed Alignment	Area of Embankments and Viaducts within the FEMA 100-Year Floodplain (acres)	Total Length of Viaduct Segment (feet)	Number of Equalizers	Area of Flood Basins and Ditches (acres)
Existing Condition	N/A	N/A	N/A	N/A
Alternative 1 (through downtown Gilroy by viaduct)	179	26,120	111	28
Alternative 2 (through downtown Gilroy by embankment)	194	23,540	111	28
Alternative 3 (through east Gilroy)	194	22,420	93	41
Alternative 4 (through downtown Gilroy, shared corridor with existing railroad)	157	23,550	105	17

5.5.7 Hydraulic Analysis Outputs

The maximum extents of the 100-year floodplain for the existing condition hydraulic analysis compared with the existing FEMA floodplain limits are illustrated on Figure 5-12. The maximum 100-year WSEs for the existing condition hydraulic analysis are illustrated on Figure 5-13. The maximum floodplain depth for the existing condition hydraulic analysis is illustrated on Figure 5-14. All three figures depict the flooded areas with a maximum 100-year flood depth greater than 0.1 foot in the existing condition's hydraulic analysis. Figure 5-15 through Figure 5-18

illustrate the change in the maximum 100-year flood elevation between the existing and four proposed conditions.

The maximum 100-year floodplain elevation in the Soap Lake floodplain area varies from approximately 150 feet to 155 feet NAVD 88. The flood elevation in the City of Gilroy varies from approximately 185 feet to 200 feet NAVD 88 (Figure 5-13). The footprint of the 100-year floodplain of the existing condition model is similar to the extents of the FEMA 100-year floodplain near the Soap Lake outlet in the toe of the foothills on the eastern side of the floodplain and the south side downstream of the existing railroad crossing. The extents of the 100-year floodplain are larger on the south side on the upstream side of the existing railroad crossing because of the concentrated flood flow for unnamed streams (PJ-2 south) entering the Soap Lake floodplain from south on east of Frazier Lake Road, which is not shown in the FEMA FIRM.

Figure 5-12 also indicates that the some of the areas along the railroad track between Uvas-Carnadero Creek to the west and the Pajaro River to the east that are inside the FEMA 100-year floodplain are outside the 100-year floodplain in the ICM hydraulic model. The outputs from the existing condition hydraulic analysis also showed the Jones Creek floodplain width of approximately 2,000 feet, which is substantially narrower than the floodplain width of approximately 5,000 feet from the FEMA FIRM. The extents of floodplain are narrower in the hydraulic model, most likely because the FEMA FIRM floodplain limits were delineated using an approximate method.

The embankments, viaducts, and maintenance facilities proposed for the alternatives would block the flood flow during the 100-year storm event and would cause backwater upstream of the HSR alignment.

Figure 5-15 illustrates the change in the maximum 100-year flood elevation between the existing condition and Alternative 1 with design measures and project features (HYD-IAMF#2: Flood

Protection) that minimize effects on floodplains. The proposed design measures for Alternative 1 (1) extending the viaduct segment inside the soap lake floodplain, (2) providing equalizer culverts in the embankment section, and (4) providing flood basins near the proposed maintenance facility. The total length of viaduct section in the Soap Lake floodplain is approximately 26,120 feet. The area of basins and ditches included in the hydraulic mode for Alternative 1 was approximately 28 acres, and the number of equalizer culverts was 111. With implementation of IAMFs and proposed design features, the outputs from the hydraulic analysis for Alternative 1 showed that the proposed maintenance facility and embankment/viaduct portions of the HSR alignment would have minimal effects on the vertical profile and horizontal extent of the Soap Lake floodplain during the 100-year storm event.

Figure 5-16 illustrates the change in the maximum 100-year flood elevation between the existing condition and Alternative 2 with design measures and project features (HYD-IAMF#2: Flood Protection) that minimize effects on floodplains. The proposed design measures for Alternative 1 are (1) extending the viaduct segment inside the soap lake floodplain, (2) providing equalizer culverts in the embankment section, (3) placing a lid on the trench section in Gilroy, and (4) providing flood basins near the proposed maintenance facility. The total length of viaduct section in the Soap Lake floodplain is approximately 23,540 feet. The area of basins and ditches included in the hydraulic mode for Alternative 1 was approximately 28 acres, and the number of equalizer culverts was 111. With implementation of these IAMFs and proposed design features, the outputs from the hydraulic analysis for Alternative 2 showed that the proposed maintenance facility and embankment, viaduct, and trench portions of the HSR alignment would have minimal effects on the vertical profile and horizontal extent of the Soap Lake floodplain during the 100-year storm event.

Figure 5-17 illustrates the change in the maximum 100-year flood elevation between the existing condition and Alternative 3 with design measures and project features (HYD-IAMF#2: Flood Protection) that minimize effects on floodplains. The proposed design measures for Alternative 3 are (1) extending the viaduct segment inside the soap lake floodplain, (2) providing equalizer culverts in the embankment section, (3) realigning Jones Creek, and (4) providing flood basins near the proposed maintenance facility. The total length of viaduct section in the Soap Lake floodplain is approximately 22,420 feet. The area of basins and ditches included in the hydraulic mode for Alternative 1 was approximately 41 acres, and the number of equalizer culverts included in the hydraulic model was 96. With implementation of these IAMFs and proposed design features, the outputs from the hydraulic analysis for Alternative 3 showed that the proposed maintenance facility and the embankment and viaduct portions of the HSR alignment would have minimal effects on the vertical profile and horizontal extent of the Soap Lake floodplain during the 100-year storm event.

Figure 5-18 illustrates the change in the maximum 100-year flood elevation between the existing condition and Alternative 4 with design measures and project features (HYD-IAMF#2: Flood Protection) that minimize effects on floodplains. The proposed design measures for Alternative 4 are (1) extending the viaduct segment inside the soap lake floodplain, (2) providing equalizer culverts in the embankment section, and (4) providing flood basins near the proposed maintenance facility. The total length of viaduct section in the Soap Lake floodplain is approximately 23,550 feet. The area of basins and ditches included in the hydraulic mode for Alternative 1l was approximately 17 acres, and the number of equalizer culverts included in the hydraulic model was 105. With implementation of IAMFs and proposed design features, the outputs from the hydraulic analysis for Alternative 1 showed that the proposed maintenance facility and embankment/viaduct portions of the HSR alignment would have minimal effects on the vertical profile and horizontal extent of the Soap Lake floodplain during the 100-year storm event.

APPENDIX 3.8-C: BASIN PLAN WATER QUALITY IMPACT ASSESSMENT

APPENDIX 3.8-C: BASIN PLAN WATER QUALITY IMPACT ASSESSMENT

This Volume 2 technical appendix compiles information regarding the existing surface water quality conditions for waterbodies in the San Jose to Central Valley Wye Project Extent (project) footprint as documented in the San Francisco Bay, Central Coast, and Central Valley Regional Water Quality Control Boards' (RWQCB) Basin Plans. This appendix also summarizes potential impacts on each waterbody by alternative according to Section 3.8, Hydrology and Water Resources, of this Final environmental impact report (EIR)/environmental impact statement (EIS). The purpose of this appendix is to summarize impacts on waterbodies and Basin Plans to inform the Clean Water Act Section 401 Water Quality Certification.

Beneficial Uses in the RSA

Most of the waterbodies within the surface water resource study area (RSA) provide both economic and environmental beneficial uses. Economic beneficial uses include agricultural water supply (AGR), commercial and sport fishing (COMM), industrial service supply (IND), navigation (NAV), hydropower generation (POW), water recreation (contact [REC-1] and non-contact [REC-2]), and shellfish harvesting (SHELL). Environmental beneficial uses include preservation of biological habitats of special significance (BIOL), cold freshwater habitat (COLD), estuarine habitat (EST), freshwater replenishment (FRSH), groundwater recharge (GWR), fish migration (MIGR), preservation of rare and endangered species (RARE), fish spawning (SPWN), warm freshwater habitat (WARM), and wildlife habitat (WILD). Table 1 lists the waterbodies that have been identified within the RSA in alphabetical order and lists their beneficial uses. It also indicates whether the waterbody is within the project footprint.

Table 1 Beneficial Uses of Waterbodies in the RSA Identified by the San Francisco Bay, Central Coast, and Central Valley RWQCBs' Basin Plans

Waterbody	Subsection	Existing Beneficial Uses
San Francisco Bay RWQCB		
Alamitos (Los Alamitos) Creek	Not in project footprint	FRSH, GWR, COLD, MIGR, RARE, SPWN, WARM, WILD, REC-1, REC-2
Anderson Reservoir	Not in project footprint	MUN, GWR, COMM, COLD, SPWN, WARM, WILD, REC-1, REC-2
Canoas Creek	Not in project footprint	WARM, WILD, REC-1, REC-2
Coyote Creek	San Jose Diridon Station Approach, Monterey Corridor, Morgan Hill and Gilroy	GWR, COMM, COLD, MIGR, RARE, SPWN, WARM, WILD, REC-1, REC-2
Fisher Creek	Monterey Corridor, Morgan Hill and Gilroy	WARM, WILD, REC-1, REC-2
Guadalupe Creek	Not in project footprint	FRSH, GWR, COLD, MIGR, RARE, SPWN, WARM, WILD, REC-1, REC-2
Guadalupe River	San Jose Diridon Station Approach, Monterey Corridor	GWR, COLD, MIGR, RARE, SPWN, WARM, WILD, REC-1, REC-2
Lacustrine Wetlands[1]	Morgan Hill and Gilroy	AGR, COLD, FRESH, GWR, MIGR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE
Los Gatos Creek	San Jose Diridon Station Approach, Monterey Corridor	MUN, FRSH, AGR, GWR, COLD, RARE, WARM, WILD, REC-1
Palustrine Wetlands[2]	Morgan Hill and Gilroy	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE
Ross Creek	Not in project footprint	GWR, WARM, WILD, REC-1, REC-2

Waterbody	Subsection	Existing Beneficial Uses
Thompson Creek	Not in project footprint	WARM, WILD, REC-1, REC-2
Upper Penitencia Creek	Not in project footprint	FRSH, GWR, COLD, MIGR, RARE, SPWN, WARM, WILD, REC-1, REC-2
Upper Silver Creek	Not in project footprint	RARE, WARM, WILD, REC-1, REC-2
Yerba Buena Creek	Not in project footprint	WARM, WILD, REC-1, REC-2
Central Coast RWQCB		
Alamias Creek	Not in project footprint	MUN, AGR, GWR, REC-1, REC-2, WILD, COLD, WARM, MIGR, SPWN, COMM
Carnadero Creek	Morgan Hill and Gilroy	MUN, GWR, REC-1, REC-2, WILD, COLD, WARM, MIGR, RARE, COMM
Chesbro Reservoir	Not in project footprint	MUN, AGR, GWR, REC-1, REC-2, WILD, WARM, MIGR, SPWN, RARE, FRSH, NAV, COMM
Little Llagas Creek	Morgan Hill and Gilroy	MUN, AGR, GWR, REC-1, REC-2, WILD, WARM, COMM
Live Oak Creek	Not in project footprint	MUN, AGR, GWR, REC-1, REC-2, WILD, COLD, WARM, COMM
Llagas Creek (Below Chesbro Reservoir)	Morgan Hill and Gilroy	MUN, AGR, IND, GWR, REC-1, REC-2, WILD, COLD, WARM, MIGR, SPWN, RARE, COMM
Pacheco Creek	Morgan Hill and Gilroy, Pacheco Pass	MUN, AGR, GWR, REC-1, REC-2, WILD, COLD, MIGR, SPWN, BIOL, RARE, FRESH, COMM
Pajaro River	Morgan Hill and Gilroy	MUN, AGR, IND, GWR, REC-1, REC-2, WILD, COLD, WARM, MIGR, SPWN, FRESH, COMM
Pescadero Creek (tributary of San Benito River)	Not in project footprint	MUN, AGR, GWR, REC-1, REC-2, WILD, COLD, WARM, MIGR, SPWN, COMM
San Felipe Lake	Not in project footprint	MUN, AGR, GWR, REC-1, REC-2, WILD, COLD, WARM, MIGR, FRSH, NAV, COMM
Tequisquita Slough	Morgan Hill and Gilroy	GWR, REC-1, REC-2, WILD, WARM, SPWN, COMM
Uvas Creek, downstream	Morgan Hill and Gilroy	MUN, AGR, IND, GWR, REC-1, REC-2, WILD, COLD, WARM, MIGR, SPWN, RARE, COMM
Central Valley RWQCB		
Agatha Canal (North)	Not in project footprint	AGR (L), WARM (L), WILD, BIOL
California Aqueduct	Pacheco Pass	MUN, AGR, PROC, IND, POW, REC-1, REC-2, WILD
Delta-Mendota Canal	Pacheco Pass	MUN, AGR, REC-1, REC-2, WARM, WILD
Los Banos Creek	San Joaquin Valley	AGR (L), WARM (L), WILD, BIOL
Mud Slough (North)[3]	San Joaquin Valley	AGR (L), REC-1, REC-2, WILD, WARM, SPWN, COMM, SHELL
O'Neill Reservoir	Not in project footprint	MUN, AGR, REC-1, REC-2, WARM

Waterbody	Subsection	Existing Beneficial Uses
Salt Slough	Not in project footprint	AGR, REC-1, REC-2, WARM, SPWN, WILD, COMM, BIOL, SHELL
San Joaquin River (Mendota Dam to Sack Dam)	Not in project footprint	AGR, PROC, REC-1, REC-2, WARM, MIGR, SPWN, WILD
San Luis Canal	San Joaquin Valley	AGR (L), WARM (L), WILD, BIOL
San Luis Reservoir	Not in project footprint	MUN, AGR, IND, POW, REC-1, REC-2, WARM, WILD
San Luis Wasteway	San Joaquin Valley	AGR (L), WARM (L), WILD, BIOL
San Pedro Canal	San Joaquin Valley	AGR (L), WARM (L), WILD, BIOL
Santa Fe Canal	San Joaquin Valley	AGR (L), WARM (L), WILD, BIOL

AGR = agricultural supply; BIOL = preservation of biological habitats of special significance; COLD = cold freshwater habitat; COMM = commercial and sport fishing; FRSH = freshwater replenishment; GWR = groundwater recharge; IND = industrial service supply; (L) = limited beneficial use; MIGR = fish migration; MUN = municipal and domestic supply; POW = hydropower generation; PROC = industrial process supply; RARE = preservation of rare, threatened, or endangered species; REC-1 = water contact recreation; REC-2 = noncontact water recreation; SPWN = fish spawning, reproduction or early development; WARM = warm freshwater habitat; WILD = wildlife habitat
[1] Lacustrine wetlands include Coyote Creek Reservoir
[2] Palustrine wetlands include Constructed Basin 1, Coyote Creek Palustrine Forested Wetlands, Constructed Basin 2, Constructed Basin 3, Seasonal Wetland 1, Seasonal Wetland 2, Pond 1, and Constructed Basin 4
[3] Mud Slough (North) also includes the Mud Slough Alkali Marshes

Water Quality Objectives

Water quality objectives are the control and management criteria necessary to preserve the beneficial uses of a waterbody or groundwater aquifer. They are measured and analyzed through qualitative and quantitative factors. The tables in this section describe the surface water and groundwater quality objectives that were developed by the respective jurisdictional RWQCBs to protect the existing beneficial uses of surface water and groundwater within the RSA.

Table 2 Surface Water Quality Objectives

Parameter	Surface Water Quality Objective
San Francisco Bay RWQCB	
Bacteria	Water quality objectives for bacteria in Table 3-1 of the basin plan shall be strictly applied except when otherwise provided for in a TMDL.
Bioaccumulation	Controllable water quality factors shall not cause a detrimental increase in concentrations of toxic substances found in bottom sediments or aquatic life.
Biostimulatory Substances	Waters shall not contain biostimulatory substances in concentrations that promote aquatic growths to the extent that such growths cause nuisance or adversely affect beneficial uses.
Color	Waters shall be free of coloration that causes nuisance or adversely affects beneficial uses.
Dissolved Oxygen	In waters with the beneficial use of COLD, dissolved oxygen may not be depressed below 7.0 milligrams per liter. In waters with the beneficial use of warm, dissolved oxygen may not be depressed below 5.0 milligrams per liter. The basin plan also contains dissolved oxygen objectives for tidal waters.
Floating Materials	Waters shall not contain floating material, including solids, liquids, foams, and scum, in concentrations that cause nuisance or adversely affect beneficial uses.

Parameter	Surface Water Quality Objective
Oil and Grease	Waters shall not contain oils, greases, waxes, or other materials in concentrations that result in a visible film or coating on the surface of the water or on objects in the water, that cause nuisance, or that otherwise adversely affect beneficial uses.
Population and Community Ecology	All waters shall be maintained free of toxic substances in concentrations that are lethal to or that produce significant alterations in population or community ecology or receiving water biota. In addition, the health and life history characteristics of aquatic organisms in waters affected by controllable water quality factors shall not differ significantly from those for the same waters in areas unaffected by controllable water quality factors.
pH	The pH shall not be depressed below 6.5 nor raised above 8.5. This encompasses the pH range usually found in waters within the basin. Controllable water quality factors shall not cause changes greater than 0.5 units in normal ambient pH levels.
Radioactivity	Radionuclides shall not be present in concentrations that result in the accumulation of radionuclides in the food web to an extent that presents a hazard to human, plant, animal, or aquatic life. Waters designated with the beneficial use of MUN shall not contain concentrations of radionuclides in excess of the limits specified in table 4 of Section 64443 (Radioactivity) of Title 22 of the California Code of Regulations.
Salinity	Controllable water quality factors shall not increase the total dissolved solids or salinity of waters of the state so as to adversely affect beneficial uses, particularly fish migration and estuarine habitat.
Sediment	The suspended sediment load and suspended sediment discharge rate of surface waters shall not be altered in such a manner as to cause nuisance or adversely affect beneficial uses. Controllable water quality factors shall not cause a detrimental increase in the concentrations of toxic pollutants in sediments or aquatic life.
Settleable Material	Waters shall not contain substances in concentrations that result in the deposition of material that cause nuisance or adversely affect beneficial uses.
Suspended Material	Waters shall not contain suspended material in concentrations that cause nuisance or adversely affect beneficial uses.
Sulfide	All water shall be free from dissolved sulfide concentrations above natural background levels.
Tastes and Odors	Waters shall not contain taste- or odor-producing substances in concentrations that impart undesirable tastes or odors to fish flesh or other edible products of aquatic origin, that cause nuisance, or that adversely affect beneficial uses.
Temperature	The natural receiving water temperature of inland surface waters shall not be altered unless it can be demonstrated to the satisfaction of the regional board that such alteration in temperature does not adversely affect beneficial uses. In waters with the beneficial uses of warm or cold, the temperature shall not be increased by more than 5° Fahrenheit (2.8° Celsius) above natural receiving water temperature
Toxicity	All waters shall be maintained free of toxic substances in concentrations that are lethal to or that produce other detrimental responses in aquatic organisms.
Turbidity	Waters shall be free of changes in turbidity that cause nuisance or adversely affect beneficial uses. Increases from normal background light penetration or turbidity relatable to waste discharge shall not be greater than 10% in areas where natural turbidity is greater than 50 Nephelometric turbidity units (NTU).
Un-Ionized Ammonia	The discharge of wastes shall not cause receiving waters to contain concentrations of un-ionized ammonia in excess of the following limits (in milligrams per liter as Nitrogen): annual median: 0.025; maximum, central bay and upstream: 0.16; maximum, lower bay: 0.4.

Parameter	Surface Water Quality Objective
Chemical Constituents	Waters shall not contain chemical constituents in concentrations that negatively affect beneficial uses. The basin plan contains numerical water quality objectives for specific chemical constituents for specific stream types, waterbodies, watersheds, tidal areas, and beneficial uses. See the tables in chapter 3 of the basin plan for more information.
Central Coast RWQCB	
Color	Waters shall be free of coloration that causes nuisance or adversely affects beneficial uses. Coloration attributable to materials of waste origin shall not be greater than 15 units or 10% above natural background color, whichever is greater.
Tastes and Odors	Waters shall not contain taste or odor-producing substances in concentrations that impart undesirable tastes or odors to fish flesh or other edible products of aquatic origin, that cause nuisance, or that adversely affect beneficial uses.
Floating Material	Waters shall not contain floating material, including solids, liquids, foams, and scum, in concentrations that cause nuisance or adversely affect beneficial uses.
Suspended Material	Waters shall not contain suspended material in concentrations that cause nuisance or adversely affect beneficial uses.
Settleable Material	Waters shall not contain settleable material in concentrations that result in deposition of material that causes nuisance or adversely affects beneficial uses
Oil and Grease	Waters shall not contain oils, greases, waxes, or other similar materials in concentrations that result in a visible film or coating on the surface of the water or on objects in the water, that cause nuisance, or that otherwise adversely affect beneficial uses.
Biostimulatory Substances	Waters shall not contain biostimulatory substances in concentrations that promote aquatic growths to the extent that such growths cause nuisance or adversely affect beneficial uses.
Sediment	The suspended sediment load and suspended sediment discharge rate of surface waters shall not be altered in such a manner as to cause nuisance or adversely affect beneficial uses.
Turbidity	Waters shall be free of changes in turbidity that cause nuisance or adversely affect beneficial uses. Increase in turbidity attributable to controllable water quality factors shall not exceed the following limits: 1. Where natural turbidity is between 0 and 50 NTU, increases shall not exceed 20%. 2. Where natural turbidity is between 50 and 100 NTU, increases shall not exceed 10 NTU. 3. Where natural turbidity is greater than 100 NTU, increases shall not exceed 10%. Allowable zones of dilution within which higher concentrations would be tolerated would be defined for each discharge in discharge permits.
pH	In waters with the beneficial uses of MUN, AGR, REC-1, or REC-2, the pH value shall neither be depressed below 6.5 nor raised above 8.3. In waters with the beneficial uses of COLD or WARM, the pH value shall not be depressed below 7.0 or raised above 8.5. Changes in normal ambient pH levels shall not exceed 0.5 in fresh waters. For waters not mentioned by a specific beneficial use, the pH value shall not be depressed below 7.0 or raised above 8.5.

Parameter	Surface Water Quality Objective
Dissolved Oxygen	For waters not mentioned by a specific beneficial use, dissolved oxygen concentration shall not be reduced below 5.0 milligrams per liter at any time. Median values should not fall below 85% saturation as a result of controllable water quality conditions. In waters with the beneficial uses of COLD, the dissolved oxygen concentration shall not be reduced below 7.0 milligrams per liter at any time. In waters with the beneficial uses of WARM, the dissolved oxygen concentration shall not be reduced below 5.0 milligrams per liter at any time. In waters with the beneficial use of AGR, dissolved oxygen concentration shall not be reduced below 2.0 milligrams per liter at any time.
Temperature	Natural receiving water temperature of intrastate waters shall not be altered unless it can be demonstrated to the satisfaction of the regional board that such alteration in temperature does not adversely affect beneficial uses. In waters with the beneficial uses of COLD or WARM, at no time or place shall the temperature be increased by more than 5º Fahrenheit above natural receiving water temperature.
Toxicity	All waters shall be maintained free of toxic substances in concentrations which are toxic to, or which produce detrimental physiological responses in, human, plant, animal, or aquatic life.
Pesticides	No individual pesticide or combination of pesticides shall reach concentrations that adversely affect beneficial uses. There shall be no increase in pesticide concentrations found in bottom sediments or aquatic life. For waters where existing concentrations are presently nondetectable or where beneficial uses would be impaired by concentrations in excess of nondetectable levels, total identifiable chlorinated hydrocarbon pesticides shall not be present at detectable concentrations.
Organic Chemicals	Where wastewater effluents are returned to land for irrigation uses, regulatory controls shall be consistent with Title 22 of the California Code of Regulations and other relevant local controls. In waters with the beneficial use of MUN, water shall not contain concentrations of organic chemicals in excess of the limiting concentrations set forth in California Code of Regulations, title 22, chapter 15, article 5.5, section 64444.5, Table 5 and listed in Table 3-1.
Other Organics	Methylene Blue Activated Substances: 0.2 Milligrams per liter; Phenols: 0.1 Milligrams per liter; Polychlorinated Biphenyls (PCBs): 0.3 µg/L; Phthalate Esters: 0.002 µg/L
Phenol	In waters with the beneficial use of MUN, waters shall not contain phenol concentrations in excess of 1.0 micrograms per liter.
Radioactivity	Radionuclides shall not be present in concentrations that are deleterious to human, plant, animal, or aquatic life; or result in the accumulation of radionuclides in the food web to an extent which presents a hazard to human, plant, animal, or aquatic life. In waters with the beneficial use of MUN, waters shall not contain concentrations of radionuclides in excess of the limits specified in California Code of Regulations, title 22, chapter 15, article 5, sections 64441 and 64443, table 4.
Bacteria	In waters with the beneficial uses of REC-1 or REC-2, fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200/100 milliliters, nor shall more than 10% of total samples during any 30-day period exceed 400/100 milliliters.

Parameter	Surface Water Quality Objective
Chemical Constituents	In waters with the beneficial use of MUN, water shall not contain concentrations of organic chemicals in excess of the limiting concentrations set forth in California code of regulations, title 22, article 4, chapter 15, section 64435, tables 2 and 3 as listed in table 3-2. In waters with the beneficial use of AGR, waters shall not contain concentrations of chemical constituents in amounts which adversely affect the beneficial use. Waters used for irrigation and livestock watering shall not exceed concentrations for those chemicals listed in table 3-4 of the basin plan. In waters with the beneficial uses of WARM or COLD, waters shall not contain concentrations of chemical constituents known to be deleterious to fish or wildlife in excess of the limits listed in table 3-5.
Cadmium	In waters with the beneficial use of SPWN, cadmium shall not exceed 0.003 milligrams per liter in hard water or 0.0004 milligrams per liter in soft water at any time. Hard water is defined as water exceeding 100 milligrams per liter as calcium carbonate.
Central Valley RWQCB	
Bacteria	In waters designated REC-1 the fecal coliform concentration based on a minimum of not less than five samples for any 30-day period shall not exceed a geometric mean of 200/100 milliliters, nor shall more than 10% of the total number of samples taken during any 30-day period exceed 400/100 milliliters.
Biostimulatory Substances	Waters shall not contain biostimulatory substances in concentrations that promote aquatic growths in concentrations that cause nuisance or negatively affect beneficial uses.
Chemical Constituents	Waters shall not contain chemical constituents in concentrations that negatively affect beneficial uses. At a minimum, water designated MUN shall not contain concentrations of chemical constituents in excess of the Maximum Contaminant Levels specified in title 22 of the California code of regulations.
Color	Waters shall be free of discoloration that causes nuisance or negatively affects beneficial uses.
Dissolved Oxygen	Within the legal boundaries of the delta, the do concentration shall not be reduced by the amounts specified in the basin plan. For surface waterbodies outside the legal boundaries of the delta, the monthly median dissolved oxygen concentrations shall not fall below 85% of saturation in the main water mass, and the 95-percentile concentration shall not fall below 75% of saturation. The dissolved oxygen concentrations shall not be reduced below the minimum levels specified in the basin plan.
Floating Material	Waters shall not contain floating material in amounts that cause nuisance or negatively affect beneficial uses.
Methylmercury	For the delta and yolo bypass waterways listed in appendix 43 of the basin plan, the average methylmercury concentrations shall not exceed 0.08 and 0.24 milligrams of methylmercury per kilogram, wet weight, in muscle tissue of trophic level 3 and 4 fish, respectively (150–500 millimeters total length). The average methylmercury concentrations shall not exceed 0.03 milligrams of methylmercury per kilogram, wet weight, in whole fish less than 50 millimeters in length.
Oil and Grease	Waters shall not contain oils, greases, waxes, or other materials in concentrations that cause nuisance, result in a visible film or coating on the surface of the water or on objects in the water, or otherwise negatively affect beneficial uses.
pH	The pH of water shall not be depressed below 6.5, raised above 8.5, or changed at any time more than 0.3 unit from normal ambient pH.

Parameter	Surface Water Quality Objective
Pesticides	Pesticide concentrations shall not exceed the levels shown in Table Iii-2a of the Basin Plan and shall meet all other objectives listed in the Basin Plan pertaining to concentrations, discharges, total identifiable persistent chlorinated hydrocarbon pesticides, antidegradation policies, municipal supply, and thiobencarb.
Radioactivity	Radionuclides shall not be present in concentrations that are deleterious to human, plant, animal, or aquatic life nor that result in the accumulation of radionuclides in the food web to an extent that presents a hazard to human, plant, animal, or aquatic life.
Salinity	The objectives in table iii-3 of the basin plan shall be met for the specified waterbodies. Salinity objectives applicable in the delta can be found in the Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary.
Sediment	The suspended sediment load and suspended sediment discharge rate of waters shall not be altered in such a manner as to cause nuisance or negatively affect beneficial uses.
Settable Material	Waters shall not contain substances in concentrations that result in the deposition of material that causes nuisance or negatively affects beneficial uses.
Suspended Material	Waters shall not contain suspended material in concentrations that cause nuisance or negatively affect beneficial uses.
Taste and Odors	Waters shall not contain taste- or odor-producing substances in concentrations that impart undesirable tastes or odors to fish flesh or other edible products of aquatic origin, or that cause nuisance, or otherwise negatively affect beneficial uses.
Temperature	Natural receiving water temperatures of intrastate waters shall not be altered unless it can be demonstrated to the satisfaction of the RWQCB that such alteration in temperature does not negatively affect beneficial uses.
Toxicity	All waters shall be maintained free of toxic substances in concentrations that produce detrimental physiological responses in human, plant, animal, or aquatic life.
Turbidity	Waters shall be free of changes in turbidity that cause nuisance or negatively affect beneficial uses. Increases in turbidity attributable to controllable water quality factors shall not exceed limits provided in the basin plan.
Bacteria	In waters designated REC-1 the fecal coliform concentration based on a minimum of not less than five samples for any 30-day period shall not exceed a geometric mean of 200/100 milliliters, nor shall more than 10% of the total number of samples taken during any 30-day period exceed 400/100 milliliters.

RWQCB = Regional Water Quality Control Board
TMDL = total maximum daily load
AGR = agricultural supply
COLD = cold freshwater habitat
MUN = municipal and domestic supply
REC-1 = water contact recreation
REC-2 = noncontact water recreation
SPWN = fish spawning, reproduction or early development
WARM = warm freshwater habitat

Table 3 Groundwater Quality Objectives

Parameter	Groundwater Quality Objective
San Francisco Bay RWQCB	
Bacteria	For groundwater basins and/or subbasins with the beneficial use of MUN, the median of the most probable number of coliform organisms over any seven-day period shall be less than 1.1 most probable number per 100 milliliters (MPN/100 mL).
Organic and Inorganic Chemical Constituents	All groundwater shall be maintained free of organic and inorganic chemical constituents in concentrations that adversely affect beneficial uses. For groundwater basins and/or subbasins with the beneficial use of MUN, shall not contain concentrations of constituents in excess of the maximum (MCLs) or secondary maximum contaminant levels (SMCLs) specified in Table 3-5 of the basin plan. For groundwater basins and/or subbasins with the beneficial use of AGR, groundwater shall not contain concentrations of chemical constituents in excess of levels specified in Table 3-6 of the basin plan. For groundwater basins and/or subbasins with the beneficial use of IND, groundwater shall not contain pollutant levels that impair current/potential industrial uses.
Radioactivity	For groundwater basins and/or subbasins with the beneficial use of MUN, groundwater shall not contain concentrations of radionuclides in excess of the MCLs specified in Table 3-5 of the basin plan and Table 4 (Radioactivity) of Section 64443 of Title 22.
Taste and Odor	For groundwater basins and/or subbasins with the beneficial use of MUN, groundwater shall not contain taste- or odor-producing substances in concentrations that cause a nuisance or adversely affect beneficial uses. At a minimum, groundwater shall not contain concentrations in excess of SMCLs in Table 3-5 of the basin plan.
Central Coast RWQCB	
Tastes and Odors	Groundwaters shall not contain taste or odor producing substances in concentrations that adversely affect beneficial uses.
Radioactivity	Radionuclides shall not be present in concentrations that are deleterious to human, plant, animal, or aquatic life; or result in the accumulation of radionuclides in the food web to an extent which presents a hazard to human, plant, animal, or aquatic life. For groundwater basins and/or subbasins with the beneficial use of MUN, ground waters shall not contain concentrations of radionuclides in excess of the limits specified in the California Code of Regulations.
Bacteria	For groundwater basins and/or subbasins with the beneficial use of municipal and domestic supply, the median concentration of coliform organisms over any seven-day period shall be less than 2.2/100 milliliters.
Organic Chemicals	For groundwater basins and/or subbasins with the beneficial use of MUN, ground waters shall not contain concentrations of organic chemicals in excess of the maximum contaminant levels for primary drinking water standards specified in the California Code of Regulations
Inorganic Chemicals	For groundwater basins and/or subbasins with the beneficial use of MUN, groundwaters shall not contain concentrations of inorganic chemicals in excess of the maximum contaminant levels for primary drinking water standards specified in the California Code of Regulations. For groundwater basins and/or subbasins with the beneficial use of AGR, water used for irrigation and livestock watering shall not exceed the concentrations for those chemicals listed in Tables and 3-1 and 3-2 of the basin plan.

Parameter	Groundwater Quality Objective
Central Valley RWQCB	
Bacteria	For groundwater basins and/or subbasins with the beneficial use of MUN, the most probable number of coliform organisms over any seven-day period shall be less than 2.2/100 ml.
Chemical Constituents	Waters shall not contain chemical constituents in concentrations that negatively affect beneficial uses. At a minimum, water designated MUN shall not contain concentrations of chemical constituents in excess of the Maximum Contaminant Levels specified in title 22 of the California code of regulations. At a minimum, water designated MUN shall not contain lead in excess of 0.015 mg/l.
Radioactivity	At a minimum, ground waters designated for MUN shall not contain concentrations of radionuclides in excess of the MCLs specified in Section 64443 of Title 22 of the California Code of Regulations
Taste and Odors	Ground waters shall not contain taste- or odor-producing substances in concentrations that cause nuisance or adversely affect beneficial uses.
Toxicity	Ground waters shall be maintained free of toxic substances in concentrations that produce detrimental physiological responses in human, plant, animal, or aquatic life associated with designated beneficial use(s).

RWQCB = Regional Water Quality Control Board

Clean Water Act Section 303(d) List and Total Maximum Daily Loads

Section 303(d) of the Clean Water Act requires states to develop a list of waterbodies that do not meet water quality objectives. A Total Maximum Daily Load (TMDL) is a regulatory response initiated by a state to determine the loading capacity of the waterbody and to allocate that load among different pollutant sources so that the appropriate control actions can be taken and water quality standards achieved. Wasteload allocations established by TMDLs are generally implemented through requirements in National Pollutant Discharge Elimination System (NPDES) permits under Section 402 of the Clean Water Act. The TMDL process links the attainment of water quality standards in the Basin Plan with the implementation of actions required by NPDES permits that are designed to attain those standards. The table below summarizes the waterbodies in the RSA with pollution levels that consistently exceed one or more water quality objectives that cause impairments, as described on the 2014-2016 303(d) List.

Table 4 Impaired Waterbodies in the RSA

Waterbody	Impairment	Status of TMDL	Notes on TMDL
San Francisco Bay RWQCB			
Anderson Reservoir (Lake)	Mercury	TMDL required	Estimated to be complete by 2013, on Statewide Mercury Control Program for Reservoirs list
	PCBs	TMDL required	Estimated to be complete by 2019
Calabazas Creek	Diazinon	Addressed with approved TMDL	Approved in 2007; applies to all creeks and pesticides

Waterbody	Impairment	Status of TMDL	Notes on TMDL
Coyote Creek (Santa Clara County)[1]	Trash	TMDL required	Estimated attainment: 2029
	Diazinon	Addressed with approved TMDL	Approved in 2007; applies to all creeks and pesticides
	Toxicity	TMDL required	Estimated completion: 2029
Alamitos Creek	Mercury	Addressed with approved TMDL	Approved in 2010
Guadalupe Creek	Mercury	Addressed with approved TMDL	Approved in 2010
Guadalupe River[1]	Mercury	Addressed with approved TMDL	Approved in 2010
	Trash	TMDL required	Estimated attainment: 2029
	Diazinon	Addressed with approved TMDL	Approved in 2007; applies to all creeks and pesticides
Guadalupe Slough	Toxicity	TMDL required	Estimated to be complete by 2029
Los Gatos Creek (R2)[1]	Diazinon	Addressed with approved TMDL	Approved in 2007; applies to all creeks and pesticides
Oiger Quarry Ponds	Mercury	TMDL required	Estimated to be complete by 2029, on Statewide Mercury Control Program for Reservoirs list
Saratoga Creek	Trash	TMDL required	Estimated attainment: 2029
	Diazinon	Addressed with approved TMDL	Approved in 2007; applies to all creeks and pesticides
Silver Creek (Santa Clara County)	Trash	TMDL required	Estimated attainment: 2029
Central Coast RWQCB			
Carnadero Creek (Uvas Creek below Bloomfield Road) [1]	E. coli	Addressed with approved TMDL	Approved in 2010; see fecal coliform impairment
	Fecal coliform	Addressed with approved TMDL	Approved in 2010
	Low dissolved oxygen	TMDL required	Estimated to be complete by 2018
	Nitrate	TMDL required	Estimated to be complete by 2018
	Turbidity	TMDL required	Estimated to be complete by 2023
Chesbro Reservoir	Mercury	TMDL required	Estimated to be complete by 2018, on Statewide Mercury Control Program for Reservoirs list

Waterbody	Impairment	Status of TMDL	Notes on TMDL
Jones (Furlong) Creek[1]	Chlorpyrifos	Addressed with approved TMDL	Includes diazinon
	E. coli	TMDL required	Estimated to be complete by 2027
	Fecal coliform	Addressed with approved TMDL	Approved in 2010
	Nitrate	TMDL required	Estimated to be complete by 2018
	Turbidity	TMDL required	Estimated to be complete by 2023
Llagas Creek (below Chesbro Reservoir)[1]	Chloride	TMDL required	Estimated to be complete by 2027
	Chlorpyrifos	Addressed with approved TMDL	Approved in 2013
	Electrical conductivity	TMDL required	Estimated to be complete by 2027
	E. coli	TMDL required	Estimated to be complete by 2027; see fecal coliform impairment
	Fecal coliform	Addressed with approved TMDL	Approved in 2010
	Low dissolved oxygen	TMDL required	Estimated to be complete by 2018
	Sodium	TMDL required	Estimated to be complete by 2027
	Nitrate	Addressed with approved TMDL	Approved in 2006, replaces nutrients TMDL
	Total dissolved solids	TMDL required	Estimated to be complete by 2027
	Turbidity	TMDL required	Estimated to be complete by 2023
	Sedimentation/ Siltation	Addressed with approved TMDL	Approved in 2007
Millers Canal[1]	Chlorophyll-a	TMDL required	Estimated to be complete by 2018
	E. coli	TMDL required	Estimated to be complete by 2027
	Fecal coliform	Addressed with approved TMDL	Approved in 2010
	Low dissolved oxygen	TMDL required	Estimated to be complete by 2018
	Nitrate	Addressed with approved TMDL	Approved in 2006
	pH	TMDL required	Estimated to be complete by 2027
	Temperature, water	TMDL required	Estimated to be complete by 2023
	Toxicity	TMDL required	Estimated to be complete by 2023
	Turbidity	TMDL required	Estimated to be complete by 2023

Waterbody	Impairment	Status of TMDL	Notes on TMDL
Pacheco Creek[1]	Fecal coliform	Addressed with approved TMDL	Approved in 2010
	Low dissolved oxygen	TMDL required	Estimated to be complete by 2027
	Turbidity	TMDL required	Estimated to be complete by 2023
Pajaro River[1]	Boron	TMDL required	Estimated to be complete by 2027
	Chlordane	TMDL required	Estimated to be complete by 2027
	Chloride	TMDL required	Estimated to be complete by 2027
	Chlorpyrifos	Addressed with approved TMDL	Approved in 2013; includes diazinon; applies to entire watershed
	Chromium	TMDL required	Estimated to be complete by 2027
	DDD	TMDL required	Estimated to be complete by 2027
	DDE	TMDL required	Estimated to be complete by 2027
	DDT	TMDL required	Estimated to be complete by 2027
	Diazinon	Addressed with approved TMDL	Approved in 2013
	Dieldrin	TMDL required	Estimated to be complete by 2027
	E. coli	TMDL required	Estimated to be complete by 2027; see fecal coliform impairment
	Fecal coliform	Addressed with approved TMDL	Approved in 2010
	Low dissolved oxygen	TMDL required	Estimated to be complete by 2027
	PCBs	TMDL required	Estimated to be complete by 2027
	pH	TMDL required	Estimated to be complete by 2027
	Sodium	TMDL required	Estimated to be complete by 2027
	Toxicity	TMDL required	Estimated to be complete by 2023
	Turbidity	TMDL required	Estimated to be complete by 2023
	Nitrate	Addressed with approved TMDL	Approved in 2006, replaces nutrients TMDL
	Sedimentation/ Siltation	Addressed with approved TMDL	Approved in 2007

Waterbody	Impairment	Status of TMDL	Notes on TMDL
Tequisquita Slough[1]	Ammonia	TMDL required	Estimated to be complete by 2018
	Chlorophyll-a	TMDL required	Estimated to be complete by 2018
	Fecal coliform	Addressed with approved TMDL	Approved in 2010
	Low dissolved oxygen	TMDL required	Estimated to be complete by 2018
	pH	TMDL required	Estimated to be complete by 2027
	Toxicity	TMDL required	Estimated to be complete by 2023
	Turbidity	TMDL required	Estimated to be complete by 2023
Uvas Creek (below Uvas Reservoir) [1]	Low dissolved oxygen	TMDL required	Estimated to be complete by 2018
	Turbidity	TMDL required	Estimated to be complete by 2023
Central Valley RWQCB			
Agatha Canal (Merced County)	pH	TMDL required	Estimated to be complete by 2021
	Selenium	Addressed with approved TMDL	Approved in 2010
Grassland Marshes	Electrical conductivity	TMDL required	Estimated to be complete by 2027
	Selenium	Addressed with approved TMDL	Approved in 2000
Los Banos Creek (below Los Banos Reservoir, Merced County)[1]	Indicator bacteria	TMDL required	Estimated to be complete by 2021
	Total dissolved solids	TMDL required	Estimated to be complete by 2027
	Low dissolved oxygen	TMDL required	Estimated to be complete by 2023
	Toxicity	TMDL required	Estimated to be complete by 2027
Mud Slough, North (upstream of San Luis Dam)	Boron	TMDL required	Estimated to be complete by 2019
	Electrical conductivity	TMDL required	Estimated to be complete by 2019
	Indicator bacteria	TMDL required	Estimated to be complete by 2021
	Selenium	Addressed with approved TMDL	Approved 2002
	Pesticides	TMDL required	Estimated to be complete by 2019
	Toxicity	TMDL required	Estimated to be complete by 2021
O'Neill Forebay	Mercury	TMDL required	Estimated to be complete by 2012, on Statewide Mercury Control Program for Reservoirs list
	PCBs	TMDL required	Estimated to be complete by 2027
Poso Slough	Sediment toxicity	TMDL required	Estimated to be complete by 2021

Waterbody	Impairment	Status of TMDL	Notes on TMDL
San Luis Reservoir	Chlordane	TMDL required	Estimated to be complete by 2027
	Mercury	TMDL required	Estimated to be complete by 2027, on Statewide Mercury Control Program for Reservoirs list
	PCBs	TMDL required	Estimated to be complete by 2027
	Total DDT (sum of 4,4'- and 2,4'- isomers of DDT, DDE, and DDD)	TMDL required	Estimated to be complete by 2027
Salt Slough (Mud Slough to San Dam, Merced County)	Chlorpyrifos	Addressed by action other than TMDL	Expected attainment: 2026
	Toxicity	TMDL required	Estimated to be complete by 2027

Summary of Impacts on Beneficial Uses, Water Quality Objectives, and Clean Water Act Section 303(d) List impairments

The following table lists the waterbodies within the project footprint with beneficial uses designated in the respective Basin Plan. The beneficial uses of each waterbody, as listed in the respective Basin Plan, is provided, as well as the applicable Water Quality Objectives and Section 303(D) impairments, if any. Because of the vast number of waterbodies within the jurisdiction of the San Francisco Bay, Central Coast, and Central Valley RWQCBs' jurisdictions, the RWQCBs do not identify beneficial uses for each individual waterbody in their respective Basin Plans. Waterbodies that do not have individual beneficial use designations in a Basin Plan do not have any beneficial uses listed in the following table. However, the RWQCBs protect beneficial uses of waters of the state whether or not they are identified in a Basin Plan. Generally, the RWQCBs designate beneficial uses for unlisted waterbodies on a case-by-case basis. In addition, the following table identifies whether temporary, permanent, and operations impacts would occur in each waterbody. Refer to Appendix 2-E of this EIR/EIS for a description of the IAMFs that have been incorporated into the design of each of the project alternatives. Refer to Section 3.7, Biological and Aquatic Resources, for the impacts on aquatic resources and the mitigation measures due to the removal/disturbance of waterbodies and wetlands as well as tunneling below waterbodies.

Table 5 Summary of Impacts on Beneficial Uses, Water Quality Objectives, and Clean Water Act Section 303(d) List Impairments by Alternative

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
San Jose Diridon Station Approach Subsection					**Viaduct to I-880**	**Viaduct to Scott**		**Blended, At-grade**
Los Gatos Creek	San Francisco Bay	MUN, FRSH, AGR, GWR, COLD, RARE, WARM, WILD, REC-1	Diazinon	Table 3-1, Table 3-2, Table 3-4, Table 3-5, and Table 3-6. Dissolved oxygen: 7.0 milligrams per liter minimum	The project would result in minor disturbances to Los Gatos Creek during construction of a viaduct without piers inside the channel. This work may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in or near the channel of Los Gatos Creek, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains. Vegetation management may result in leaks, spills, or other discharges of pesticides to Los Gatos Creek. However, the Authority would not use diazinon for vegetation management.	Same as Alternative 1.		The project would use the existing Los Gatos Creek bridge. This work may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in or near the channel of Los Gatos Creek, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains. Vegetation management may result in leaks, spills, or other discharges of pesticides to Los Gatos Creek. However, the Authority would not use diazinon for vegetation management.
Guadalupe River	San Francisco Bay	GWR, COLD, MIGR, RARE, SPWN, WARM, WILD, REC-1, REC-2	Mercury, trash, diazinon	Table 3-2, Table 3-4, and Table 3-4A. Dissolved oxygen: 7.0 milligrams per liter minimum. Mercury: 2.4 micrograms per liter 1-hour average. Methylmercury: 0.05 milligrams per kilogram fish tissue (5–15 centimeters in length); 0.1 milligrams per kilogram fish (15–35 centimeters in length).	The project would result in minor disturbances to Guadalupe River to construct a viaduct without piers inside the channel. This work may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in or near the channel of Guadalupe River, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains. Discharges of refuse from the construction site may exacerbate the trash impairment. Construction site BMPs and good housekeeping would avoid or minimize the potential for discharging refuse into Guadalupe River. Vegetation management may result in leaks, spills, or other discharges of pesticides to Guadalupe River. However, the Authority would not use diazinon for vegetation management.	Same as Alternative 1.		The Project would build a new bridge over Guadalupe River, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the widened crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and near the Guadalupe River, such as vegetation management and bridge maintenance, as well as continuous discharges of brake dust, PAHs, and other contaminants from trains. Discharges of refuse from the construction site may exacerbate the trash impairment. Construction site BMPs and good housekeeping would avoid or minimize the potential for discharging refuse into Guadalupe River. Vegetation management may result in leaks, spills, or other discharges of pesticides to Guadalupe River. However, the Authority would not use diazinon for vegetation management.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Palustrine Forested Wetland 6	San Francisco Bay	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would result in minor disturbances to Palustrine Forested Wetland 6 in order to build a viaduct over Guadalupe River. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Palustrine Forested Wetland 6.	Same as Alternative 1.		The project would result in minor disturbances to Palustrine Forested Wetland 6 in order to build a new bridge over Guadalupe River. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Palustrine Forested Wetland 6.
Monterey Corridor Subsection					**Viaduct**	**At Grade**	**Viaduct**	**Blended, At-grade**
Constructed Basin 1	San Francisco Bay	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would partially fill Constructed Basin 1 for the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	Same as Alternative 1.	The project would have no impact on Constructed Basin 1 because it is not within the footprint of Alternative 4.
Constructed Watercourse 1	San Francisco Bay	None designated in the Basin Plan	None listed.	Table 3-4	The project would permanently relocate or fill Constructed Watercourse 1, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. If the waterbody is relocated, Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the watercourse, such as vegetation management, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	Same as Alternative 1.	The project would result in minor disturbances to Constructed Watercourse 1 for construction access. This work may potentially result in erosion or discharge of polluted runoff. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.
Constructed Basin 10	San Francisco Bay	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would result in minor disturbances to Constructed Basin 10 because it is located within a temporary construction easement. Nearby activities may potentially result in erosion or discharge of polluted runoff. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	Same as Alternative 1.	The project would require filling the entire basin for curve straightening, requiring temporary diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Morgan Hill and Gilroy Subsection					**Viaduct to Downtown Gilroy**	**Embankment to Downtown Gilroy**	**Viaduct to East Gilroy**	**Blended, At-grade**
Coyote Alamitos Canal	San Francisco Bay	None designated in the Basin Plan	None listed.	Table 3-4	The project would have no impact on Coyote Alamitos Canal because it is not within the footprint of Alternative 1.	The project would have no impact on Coyote Alamitos Canal, because it would be protected during construction. Operations would avoid the canal.	Same as Alternative 1.	Same as Alternative 1.
Coyote Creek	San Francisco Bay	GWR, COMM, COLD, MIGR, RARE, SPWN, WARM, WILD, REC-1, REC-2	Trash, diazinon, toxicity	Table 3-1, Table 3-2, and Table 3-4. Dissolved oxygen: 7.0 milligrams per liter minimum.	The project would modify the Metcalf Road bridge over Coyote Creek, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the modified bridge would change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains. Discharges of refuse from the construction site may exacerbate the trash impairment. Discharges of any pollutant from the construction site may exacerbate the toxicity impairment. Construction site BMPs would avoid or minimize the potential for discharging refuse and other toxic contaminants into Coyote Creek. Vegetation management may result in leaks, spills, or other discharges of pesticides to Coyote Creek. However, the Authority would not use diazinon for vegetation management.	The project would modify the Metcalf Road bridge over Coyote Creek and the Fisher Creek culvert, requiring temporary stream diversion and dewatering, and provide a grade separation at the Bailey Avenue bridge. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the grade separation would change the path, speed, and volume of existing discharges and flows. Operations would avoid Coyote Creek. Discharges of refuse from the construction site may exacerbate the trash impairment. Discharges of any pollutant from the construction site may exacerbate the toxicity impairment. Construction site BMPs would avoid or minimize the potential for discharging refuse and other toxic contaminants into Coyote Creek. Vegetation management may result in leaks, spills, or other discharges of pesticides to Coyote Creek. However, the Authority would not use diazinon for vegetation management.	Same as Alternative 1.	The project would require temporary stream diversion and dewatering of Coyote Creek in order to modify the Fisher Creek culvert and wildlife crossing. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the grade separation would change the path, speed, and volume of existing discharges and flows. Operations would avoid Coyote Creek. Discharges of refuse from the construction site may exacerbate the trash impairment. Discharges of any pollutant from the construction site may exacerbate the toxicity impairment. Construction site BMPs would avoid or minimize the potential for discharging refuse and other toxic contaminants into Coyote Creek. Vegetation management may result in leaks, spills, or other discharges of pesticides to Coyote Creek. However, the Authority would not use diazinon for vegetation management.
Coyote Creek Reservoir	San Francisco Bay	AGR, COLD, FRESH, GWR, MIGR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would require filling a portion the reservoir to modify the Metcalf Road bridge over the Coyote Creek Reservoir, requiring temporary stream diversion and dewatering in Coyote Reservoir. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the modified bridge would change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	The project would result in minor disturbances to the Coyote Creek Reservoir within the temporary construction easement at Bailey Avenue bridge. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Coyote Creek Reservoir.	Same as Alternative 1.	The project would have no impact on Coyote Creek Reservoir because it is not within the footprint of Alternative 4.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Coyote Creek Palustrine Forested Wetlands	San Francisco Bay	AGR, COLD, FRESH, GWR, MIGR, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would widen Monterey Road into Coyote Creek Palustrine Forested Wetlands, requiring temporary stream diversion and dewatering. A utility pipeline relocation would also temporarily disturb the wetland. This work may potentially result in erosion or discharge of polluted runoff. Grading for the widened crossing would change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains to Coyote Creek Palustrine Forested Wetlands.	The project would require temporary stream diversion and dewatering of the wetlands in order to build a wildlife crossing. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Coyote Creek Palustrine Forested Wetlands.	Same as Alternative 1.	The project would temporarily disturb Coyote Creek Palustrine Forested Wetlands to construct wildlife crossings and a culvert in Fisher Creek, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Coyote Creek Palustrine Forested Wetlands.
Marsh 8	San Francisco Bay	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would have no impact on Marsh 8 because it is not within the footprint of Alternative 1.	The project would result in minor disturbances to the marsh because it is located within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the marsh.	Same as Alternative 1.	The project would result in minor disturbances to the marsh during construction of a wildlife crossing. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the marsh.
Constructed Watercourse 124	San Francisco Bay	None designated in the Basin Plan	None listed.	Table 3-4	The project would have no impact on Constructed Watercourse 124, because it would be protected during construction. Operations would avoid the watercourse.	Same as Alternative 1.	Same as Alternative 1.	The project would have no impact on Constructed Watercourse 124 because it is not within the footprint of Alternative 4.
Seasonal Wetland 14	San Francisco Bay	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would result in minor disturbances to the wetland because it is located within a temporary construction easement associated with raising existing overhead electrical lines. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the wetland.	The project would have no impact on Seasonal Wetland 14, because it would be protected during construction. Operations would avoid the watercourse.	Same as Alternative 1.	The project would have no impact on Seasonal Wetland 14 because it is not within the footprint of Alternative 4.
Fisher Creek	San Francisco Bay	WARM, WILD, REC-1, REC-2	None listed.	Table 3-1, Table 3-2, and Table 3-4. Dissolved oxygen: 5.0 milligrams per liter minimum.	The project would temporarily disturb Fisher Creek to abandon, remove, and replace the existing culvert with a proposed wildlife crossing/culvert. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the channel, such as vegetation management and culvert maintenance as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	Same as Alternative 1.	The project would construct a new culvert/wildlife crossing in Fisher Creek. This work may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in or near the channel, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Coyote Canal Extension	San Francisco Bay	None designated in the Basin Plan	None listed.	Table 3-4	The project would result in minor disturbances to Coyote Canal Extension, because of a proposed temporary roadway crossing required for PG&E network upgrades. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Coyote Canal Extension.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
Constructed Watercourse 125	San Francisco Bay	None designated in the Basin Plan	None listed.	Table 3-4	The project would have no impact on Constructed Watercourse 125 because it is not within the footprint of Alternative 1.	Same as Alternative 1.	Same as Alternative 1.	The project would result in minor disturbances to the watercourse for construction access. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the wetland.
Constructed Watercourse 126	San Francisco Bay	None designated in the Basin Plan	None listed.	Table 3-4	The project would have no impact on Constructed Watercourse 126 because it is not within the footprint of Alternative 1.	Same as Alternative 1.	Same as Alternative 1.	The project would result in minor disturbances to the watercourse for construction access. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the wetland.
Seasonal Wetlands 15–16	San Francisco Bay	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would involve a temporary roadway crossing for PG&E upgrades, requiring work in the wetlands. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the wetlands.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
Coyote Canal	San Francisco Bay	None designated in the Basin Plan	None listed.	Table 3-4	The project would involve a temporary roadway crossing for PG&E network upgrades, requiring work in the canal, and temporary disturbances during installation of a nearby steel lattice tower. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Coyote Canal.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
Coyote Creek Tributaries 1–8	San Francisco Bay	GWR, COMM, COLD, MIGR, RARE, SPWN, WARM, WILD, REC-1, REC-2	Trash, diazinon, toxicity	Table 3-1, Table 3-2, and Table 3-4. Dissolved oxygen: 7.0 milligrams per liter minimum.	The project would involve a temporary roadway crossings for these waterbodies to build PG&E upgrades, requiring work in tributaries 1, 5, 6, and 8. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid these Coyote Creek tributaries.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
Constructed Watercourse 127 and 129	San Francisco Bay	None designated in the Basin Plan	None listed.	Table 3-4	The project would involve a temporary roadway crossing for PG&E upgrades, requiring work in these watercourses. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid these watercourses.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 161	San Francisco Bay	None designated in the Basin Plan	None listed.	Table 3-4	The project would have no impact on Constructed Watercourse 161 because it is not within the footprint of Alternative 1	The project would relocate the watercourse and build a culvert in the watercourse for the Live Oak Avenue grade separation, requiring work in the waterbody and temporary stream diversion and dewatering. Operations would avoid the watercourse.	Same as Alternative 1.	Same as Alternative 1.
Coyote Canal Tributary 1	San Francisco Bay	None designated in the Basin Plan	None listed.	Table 3-4	The project would involve a temporary roadway crossing for PG&E upgrades, requiring work in Coyote Canal Tributary 1. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the tributary.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
Constructed Watercourse 130	San Francisco Bay	None designated in the Basin Plan	None listed.	Table 3-4	The project would have no impact on Constructed Watercourse 130 because it is not within the footprint of Alternative 1	The project would relocate or fill the watercourse to realign Monterey Road, requiring work in the waterbody and temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	Same as Alternative 1.
Cochran Channel	San Francisco Bay	None designated in the Basin Plan	None listed.	Table 3-4	The project would result in minor disturbances to Cochran Channel because it is within several utility temporary construction easements. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Cochran Channel.	The project would have no impact on Cochran Channel because it is not within the footprint of Alternative 2.	Same as Alternative 1.	Same as Alternative 2.
Constructed Basin 2	San Francisco Bay	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would have no impact on Constructed Basin 2 because it is not within the footprint of Alternative 1.	The project would fill a portion of Constructed Basin 2 to construct an embankment for the Madrone Parkway grade separation, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new embankment would also change the path, speed, and volume of existing discharges and flows. Operations would avoid Constructed Basin 2.	Same as Alternative 1.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Seasonal Wetland 18	San Francisco Bay	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would have no impact on Seasonal Wetland 18 because it is not within the footprint of Alternative 1.	The project would fill a portion of Seasonal Wetland 18 to construct an embankment for the Madrone Parkway grade separation. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new embankment would also change the path, speed, and volume of existing discharges and flows. Operations would the wetland.	Same as Alternative 1.	Same as Alternative 1.
Constructed Basin 3	San Francisco Bay	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would have no impact on Constructed Basin 3 because it is not within the footprint of Alternative 1.	The project would fill a portion of Constructed Basin 3 to relocate Monterey Road, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would avoid Constructed Basin 3.	Same as Alternative 1.	Same as Alternative 1.
Seasonal Wetland 17	San Francisco Bay	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would have no impact on Seasonal Wetland 17 because it is not within the footprint of Alternative 1.	The project would result in minor disturbances to Seasonal Wetland 17 because it is within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the wetland.	Same as Alternative 1.	Same as Alternative 1.
Seasonal Wetland 1	San Francisco Bay	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would have no impact on Seasonal Wetland 1 because it is not within the footprint of Alternative 1.	The project would partially fill Seasonal Wetland 1 for the relocation of Monterey Road, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would avoid Seasonal Wetland 1.	Same as Alternative 1.	The project would result in minor disturbances to Seasonal Wetland 1, because it is within a temporary construction easement for construction access. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Seasonal Wetland 1.
Fisher Creek Tributary 1	San Francisco Bay	WARM, WILD, REC-1, REC-2	None listed.	Table 3-1, Table 3-2, and Table 3-4. Dissolved oxygen: 7.0 milligrams per liter minimum.	The project would have no impact on Fisher Creek Tributary 1 because it is not within the footprint of Alternative 1.	The project would result in minor disturbances to Fisher Creek Tributary 1, because it is within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the creek.	Same as Alternative 1.	The project would result in minor disturbances to Fisher Creek Tributary 1, because it is within a temporary construction easement for construction access. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the creek.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Seasonal Wetland 2	San Francisco Bay	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would construct a temporary roadway crossing over Seasonal Wetland 2 for PG&E network upgrades, requiring work in the wetland. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Seasonal Wetland 2.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
West Little Llagas Creek Tributary 1 and 2	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum	The project would construct a temporary roadway crossing over West Little Llagas Creek Tributary 1 and 2 for PG&E network upgrades, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid West Little Llagas Creek Tributary 1 and 2.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
Constructed Basin 11	San Francisco Bay	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would have no impact on Constructed Basin 11 because it is not within the footprint of Alternative 1.	The project would completely fill Constructed Basin 11 to construct the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. This would also cause a depletion of water resources within the project extent. Operations would not affect Constructed Basin 11.	Same as Alternative 1.	The project would result in minor disturbances to Constructed Basin 11, because it is within a temporary construction easement for construction access. This work may potentially result in erosion or discharge of polluted runoff. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.
Constructed Basin 4	San Francisco Bay / Central Coast	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	San Francisco Bay RWQCB: Table 3-4. Central Coast RWQCB: Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum	The project would have no impact on Constructed Basin 4 because it is not within the footprint of Alternative 1.	The project would fill a portion of Constructed Basin 4 and offset capacity loss by expanding another portion of the basin, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Madrone Channel	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Madrone Channel, because it is within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Madrone Channel.	The project would have no impact on Madrone Channel because it is not within the footprint of Alternative 2.	Same as Alternative 1.	Same as Alternative 2.
Butterfield Channel	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Butterfield Channel, because it is within temporary construction easements. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Butterfield Channel.	The project would relocate a portion of Butterfield Channel in order to construct the track embankment and reconstruct a culvert at Maple Avenue, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the channel, such as vegetation management and culvert maintenance as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	There would be no effect on Butterfield Channel because construction of the project would be confined to the paved areas on Main Avenue. Operations would avoid Butterfield Channel.
West Little Llagas Creek	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to West Little Llagas Creek, because it is within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid West Little Llagas Creek.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Seasonal Wetland 19	San Francisco Bay	AGR, COLD, FRESH, GWR, NAV, REC-1, REC-2, SPWN, WARM, WILD, RARE	None listed.	Table 3-4	The project would have no impact on Seasonal Wetland 19 because it is not within the footprint of Alternative 1.	The project would partially fill Seasonal Wetland 19 for maintenance access, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the channel, such as vegetation management and culvert maintenance as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	Same as Alternative 1.
Constructed Basin 5	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Constructed Basin 5 because it is not within the footprint of Alternative 1.	The project would result in minor disturbances to Constructed Basin 5, because it is within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	Same as Alternative 1.
Constructed Basin 6	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Constructed Basin 6 because it is not within the footprint of Alternative 1.	The project would partially fill Constructed Basin 6 and expand another portion of the basin to offset capacity loss, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would avoid the basin.	Same as Alternative 1.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Little Llagas Creek	Central Coast	MUN, AGR, GWR, REC-1, REC-2, WILD, WARM, COMM	None listed.	Table 3-1, Table 3-2, Table 3-3, Table 3-4, Table 3-5 Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter Fecal coliform[1, 2] pH: 7.0 minimum, 8.3 maximum Phenol: 1.0 microgram per liter maximum Temperature: 5 degrees Fahrenheit increase maximum Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum	The project would result in minor disturbances to Little Llagas Creek to construct a viaduct without piers inside the channel and new high-voltage utility crossings. This work may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in or near Little Llagas Creek, such as vegetation management, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	The project would construct a new culvert crossing for Little Llagas Creek, requiring work in the waterbody, and new high-voltage utility crossings. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near Little Llagas Creek, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	The project would extend the existing Little Llagas Creek culvert, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in or near Little Llagas Creek, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Llagas Creek	Central Coast	MUN, AGR, IND, GWR, REC-1, REC-2, WILD, COLD, WARM, MIGR, SPWN, RARE, COMM	Chloride, chlorpyrifos, electrical conductivity, E. coli, fecal coliform, low dissolved oxygen, sodium, nitrate, total dissolved solids, turbidity, sedimentation / siltation	Table 3-1, Table 3-2, Table 3-3, Table 3-4, Table 3-5, Table 3-7 Cadmium: 0.003 milligrams per liter in hard water,[3] 0.0004 milligrams per liter in soft water. Dissolved oxygen: shall not be reduced below 7.0 milligrams per liter. Fecal coliform[1, 2]. pH: 7.0 minimum, 8.3 maximum. Phenol: 1.0 microgram per liter maximum. Temperature: 5 degrees Fahrenheit increase maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum	The project would result in minor disturbances to Llagas Creek to construct a viaduct without piers inside the channel and two new high-voltage utility crossings. This work may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in or near Llagas Creek, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains. Leaks of pesticides from vegetation management during construction and operations may exacerbate the pesticides impairment. The Authority would not use chlorpyrifos for vegetation management; however, reduced shading would result from ongoing vegetation management during operations, resulting in decreased dissolved oxygen levels. Increased iron from brake dust, PAHs, may also exacerbate the low dissolved oxygen impairment through the stimulation of microorganism growth. Discharges of bacterial pathogens from sanitary waste during construction may exacerbate the E. coli and fecal coliform impairments. However, construction site BMPs would avoid or minimize the potential for discharging sanitary waste. Work in and near Llagas Creek during construction, bridge/culvert maintenance, and discharges of brake dust, PAHs, may exacerbate the turbidity and sedimentation impairments. Discharges of brake dust, PAHs, may also exacerbate the electrical conductivity and dissolved solids impairments.	The project would remove the existing railroad bridge, relocate Monterey Road to cross Llagas Creek to the west of the existing crossing, modify the Upper Llagas Creek Flood Protection Project in coordination with the Santa Clara Valley Water District, and add a new crossing for the West San Martin Avenue grade separation, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near Llagas Creek, such as vegetation management and culvert/bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains. Leaks of pesticides from vegetation management during construction and operations may exacerbate the pesticides impairment. The Authority would not use chlorpyrifos for vegetation management; however, reduced shading would result from ongoing vegetation management during operations, resulting in decreased dissolved oxygen levels. Increased iron from brake dust, PAHs, may also exacerbate the low dissolved oxygen impairment through the stimulation of microorganism growth. Discharges of bacterial pathogens from sanitary waste during construction may exacerbate the E. coli and fecal coliform impairments. However, construction site BMPs would avoid or minimize the potential for discharging sanitary waste. Work in and near Llagas Creek during construction, bridge/culvert maintenance, and discharges of brake dust, PAHs, may exacerbate the turbidity and sedimentation impairments. Discharges of brake dust, PAHs, may also exacerbate the electrical conductivity and dissolved solids impairments.	The project would construct a new viaduct crossing over Llagas Creek, a new bridge crossing with piers in the channel requiring work in the waterbody, and two new high-voltage utility crossings over Llagas Creek. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossings would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near Llagas Creek, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains. Leaks of pesticides from vegetation management during construction and operations may exacerbate the pesticides impairment. The Authority would not use chlorpyrifos for vegetation management; however, reduced shading would result from ongoing vegetation management during operations, resulting in decreased dissolved oxygen levels. Increased iron from brake dust, PAHs, may also exacerbate the low dissolved oxygen impairment through the stimulation of microorganism growth. Discharges of bacterial pathogens from sanitary waste during construction may exacerbate the E. coli and fecal coliform impairments. However, construction site BMPs would avoid or minimize the potential for discharging sanitary waste. Work in and near Llagas Creek during construction, bridge/culvert maintenance, and discharges of brake dust, PAHs, may exacerbate the turbidity and sedimentation impairments. Discharges of brake dust, PAHs, may also exacerbate the electrical conductivity and dissolved solids impairments.	The project would reconstruct the existing Llagas Creek culvert, requiring work in the waterbody, and construct a new high voltage utility crossing. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near Llagas Creek, such as vegetation management and culvert/bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains. Leaks of pesticides from vegetation management during construction and operations may exacerbate the pesticides impairment. The Authority would not use chlorpyrifos for vegetation management; however, reduced shading would result from ongoing vegetation management during operations, resulting in decreased dissolved oxygen levels. Increased iron from brake dust, PAHs, may also exacerbate the low dissolved oxygen impairment through the stimulation of microorganism growth. Discharges of bacterial pathogens from sanitary waste during construction may exacerbate the E. coli and fecal coliform impairments. However, construction site BMPs would avoid or minimize the potential for discharging sanitary waste. Work in and near Llagas Creek during construction, bridge/culvert maintenance, and discharges of brake dust, PAHs, may exacerbate the turbidity and sedimentation impairments. Discharges of brake dust, PAHs, may also exacerbate the electrical conductivity and dissolved solids impairments.

Constructed Basin 7	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would fill a portion of Constructed Basin 7 within the proposed right-of-way, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	Same as Alternative 1.	The project would have no impact on Constructed Basin 7 because it is not within the footprint of Alternative 4.
West Branch Llagas Creek	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would extend the existing box culvert, requiring work in the waterbody, and construct three new high-voltage utility crossings over West Branch Llagas Creek. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near West Branch Llagas Creek, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	The project would extend the existing box culvert and construct a new crossing at the Masten Avenue grade separation, requiring work in the waterbody, and construct three new high-voltage utility crossings over West Branch Llagas Creek. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near West Branch Llagas Creek, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	The project would result in minor disturbances to West Branch Llagas Creek to construct a new high-voltage utility crossing. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid West Branch Llagas Creek.	The project would use the existing West Branch Llagas Creek culvert and result in minor disturbances within temporary construction easements for utility and PG&E network upgrades. This work may potentially result in erosion or discharge of polluted runoff. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.
West Branch Llagas Creek Tributary 1	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would construct a temporary roadway crossing for PG&E network upgrades, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid West Branch Llagas Creek Tributary 1.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.

Constructed Watercourse 3	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Constructed Watercourse 3 because it is not within the footprint of Alternative 1.	The project would result in minor disturbances to Constructed Watercourse 3, because it is within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Constructed Watercourse 3.	Same as Alternative 1.	Same as Alternative 1.
Constructed Watercourse 131	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would construct a viaduct over Constructed Watercourse 131 and relocate the waterbody around a viaduct pier, requiring temporary stream diversion, dewatering, and work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near Constructed Watercourse 131, such as vegetation management, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	The project would relocate or provide a culvert for a proposed cul-de-sac and build a new crossing at realigned Monterey Road for the Masten Avenue grade separation, requiring temporary stream diversion, dewatering, and work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near Constructed Watercourse 131, such as vegetation management, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains	The project would have no impact on Constructed Watercourse 131 because it is not within the footprint of Alternative 3.	The project would result in minor disturbances to Constructed Watercourse 131, because it is within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse.
Constructed Watercourse 132	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Constructed Watercourse 132 because it is not within the footprint of Alternative 1.	The project would relocate the watercourse around a proposed pump station, requiring temporary stream diversion, dewatering, and work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would avoid the watercourse.	The project would have no impact on Constructed Watercourse 132 because it is not within the footprint of Alternative 3	Same as Alternative 3.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Upper Miller Slough	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would construct a new viaduct crossing and armor the channel to protect the viaduct piers on the top of the bank, requiring work in the waterbody, as well as construct a new high-voltage utility crossing over Upper Miller Slough. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near Upper Miller Slough, such as vegetation management and culvert/bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	The project would relocate Upper Miller Slough to cross below the track embankment and add several new culverts, requiring work in the waterbody, as well as construct a new high-voltage utility crossing. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near Upper Miller Slough, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	The project would result in minor disturbances to Upper Miller Slough to construct a new high-voltage utility crossing. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Upper Miller Slough.	The project would remove and replace the existing bridge over Upper Miller Slough with a 3-cell box culvert with 10-ft wide and 7-ft high cells, requiring work in the waterbody. New utility crossings would also be constructed. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near Upper Miller Slough, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.
Lower Miller Slough	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Lower Miller Slough because it is within temporary construction easements. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Lower Miller Slough.	The project would have no impact on Lower Miller Slough because it is not within the footprint of Alternative 2.	The project would result in minor disturbances to Lower Miller Slough to construct a new utility crossing. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Lower Miller Slough.	Same as Alternative 2.
Palustrine Forested Wetland 7 and 9	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Palustrine Forested Wetland 7 and 9 because they are not within the footprint of Alternative 1.	Same as Alternative 1.	The project would result in minor disturbances to Palustrine Forested Wetland 7 and 9 to construct new utility crossings. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Lower Miller Slough.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Princevalle Channel	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Princevalle Channel to construct a viaduct without piers inside the channel. This work may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in or near the waterbody, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	The project would extend the existing Princevalle Channel culvert, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in or near the waterbody, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	The project would have no impact on Princevalle Channel because it is not within the footprint of Alternative 3.	Same as Alternative 2.
Dexter Creek	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Dexter Creek because it is not within the footprint of Alternative 1.	Same as Alternative 1.	The project would construct two new culverts in Dexter Creek for the SR 152 grade separation and add a culvert for a farm access road, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the grade separation and farm access road would also change the path, speed, and volume of existing discharges and flows. Operations would avoid Dexter Creek.	Same as Alternative 1.
Marsh 1	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Marsh 1 because it is not within the footprint of Alternative 1.	Same as Alternative 1.	The project would completely fill Marsh 1 to construct the East Gilroy MOWF. This work may potentially result in erosion or discharge of polluted runoff. Operations would not affect Marsh 1.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Jones Creek	Central Coast	None designated in the Basin Plan	Chlorpyrifos, E. coli, fecal coliform, nitrate, turbidity	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. Fecal coliform[1]. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Joens Creek because it is not within the footprint of Alternative 1.	Same as Alternative 1.	The project would relocate the Jones Creek channel along the northeastern boundary of the East Gilroy MOWF and cross the track below a proposed viaduct, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing and East Gilroy MOWF would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near Jones Creek, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains. Leaks of pesticides from vegetation management during construction and operations would not exacerbate the chlorpyrifos impairment, because the Authority would not use chlorpyrifos during construction and operations. Construction site BMPs would avoid or minimize potential discharges of sanitary waste from the construction site. Work in and near Jones Creek during construction, bridge maintenance, and the release of brake dust, PAHs, and other contaminants from trains may exacerbate the turbidity and sedimentation impairments. However, construction site BMPs would minimize the potential for discharging sediment to the creek during the construction and operations.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
San Ysidro Creek	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on San Ysidro Creek because it is not within the footprint of Alternative 1.	Same as Alternative 1.	The project would add a culvert for a farm access road and connect the creek to the relocated Jones Creek channel, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and channel modifications for the East Gilroy MOWF and farm access road would also change the path, speed, and volume of existing discharges and flows. Operations would avoid the waterbody.	Same as Alternative 1.
Constructed Watercourse 4	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Constructed Watercourse 4 because it is not within the footprint of Alternative 1.	Same as Alternative 1.	The project would relocate Constructed Watercourse 4 along the proposed farm access road. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and relocating the channel for the farm access road would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near Constructed Watercourse 4, such as vegetation management, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 5	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Constructed Watercourse 5 because it is not within the footprint of Alternative 1.	Same as Alternative 1.	The project would result in minor disturbances to Constructed Watercourse 5 to construct a viaduct without piers inside the channel. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges to and existing flows within the waterbody. Operations would include intermittent work in or near Constructed Watercourse 5, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.
Constructed Watercourse 6	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Constructed Watercourse 6 because it is not within the footprint of Alternative 1.	Same as Alternative 1.	The project would add a culvert for a proposed farm access road, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the farm access road would also change the path, speed, and volume of existing discharges and flows. Operations would avoid the watercourse.	Same as Alternative 1.
Constructed Basin 12 and 13	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Constructed Basin 12 and 13 because they are not within the footprint of Alternative 1.	Same as Alternative 1.	Same as Alternative 1.	The project would require completely filling these constructed basins to build the railbed leading to the South Gilroy MOWF, requiring temporary stream diversion, dewatering, and work in the waterbodies. This work may potentially result in erosion or discharge of polluted runoff. Operations would not affect these basins.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 7	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would construct new culverts in Constructed Watercourse 7 and the waterbody would be partially filled for construction of a retaining wall, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near Constructed Watercourse 7, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	The project would have no impact on Constructed Watercourse 7 because it is not within the footprint of Alternative 3.	Same as Alternative 3.
Gilroy Wastewater Treatment Ponds	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would fill a portion of the Gilroy Wastewater Treatment Ponds to construct the railbed leading to the South Gilroy MOWF, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to these waterbodies would change the areas and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	The project would have no impact on the Gilroy Wastewater Treatment Ponds because they are not within the footprint of Alternative 3.	Same as Alternative 3.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 156	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would relocate, fill, or culvert the watercourse to build the South Gilroy MOWF, requiring temporary stream diversion, dewatering, and work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to these waterbodies would change the areas and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near Constructed Watercourse 156, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	The project would have no impact on Constructed Watercourse 156 because it is not within the footprint of Alternative 3.	Same as Alternative 3.
Constructed Watercourse 8	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Constructed Watercourse 8 because it is within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Constructed Watercourse 8.	Same as Alternative 1.	The project would result in minor disturbances to Constructed Watercourse 8 construct a new high-voltage utility crossing. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Constructed Watercourse 8.	Same as Alternative 3.
Constructed Watercourse 9	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Constructed Watercourse 9 because it is not within the footprint of Alternative 1.	Same as Alternative 1.	The project would result in minor disturbances to Constructed Watercourse 9 because it is within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Constructed Watercourse 9.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 10	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Constructed Watercourse 10 because it is not within the footprint of Alternative 1.	Same as Alternative 1.	The project would construct a new culvert within Constructed Watercourse 10, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near Constructed Watercourse 10, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.
Constructed Watercourse 11	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Constructed Watercourse 11 because it is not within the footprint of Alternative 1.	Same as Alternative 1.	The project would involve construction of a new culvert within Constructed Watercourse 11, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near Constructed Watercourse 11, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 12	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Constructed Watercourse 12 because it is not within the footprint of Alternative 1.	Same as Alternative 1.	The project would result in minor disturbances to Constructed Watercourse 12, which would be protected in place during construction. This work may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in or near Constructed Watercourse 12, such as vegetation management, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Pajaro River	Central Coast	MUN, AGR, IND, GWR, REC-1, REC-2, WILD, COLD, WARM, MIGR, SPWN, FRESH, COMM	Boron, chlordane, chloride, chlorpyrifos, DDD, DDE, DDT, diazinon, dieldrin, E. coli, fecal coliform, low dissolved oxygen, nitrate, nutrients, PCBs, pH, sodium, toxicity, turbidity, nitrate, sedimentation / siltation	Table 3-1, Table 3-2, Table 3-3, Table 3-4, Table 3-5, Table 3-7 Cadmium: 0.003 milligrams per liter in hard water[3], 0.0004 milligrams per liter in soft water Dissolved oxygen: shall not be reduced below 7.0 milligrams per liter Fecal coliform[1, 2] pH: 7.0 minimum, 8.3 maximum Phenol: 1.0 microgram per liter maximum Temperature: 5 degrees Fahrenheit increase maximum Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum	The project would construct a new viaduct crossing with a pier footing within the channel banks, requiring temporary stream diversion and dewatering, and a new high-voltage utility crossing over Pajaro River. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossings would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near Pajaro River, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains. Leaks of pesticides from vegetation management during construction and operations may result in discharges of pesticides to Pajaro River. However, the Authority would not use chlorpyrifos, chlordane, DDD, DDE, DDT, diazinon, and dieldrin during construction and operations. Vegetation management, reduced shading over Pajaro River, and discharges of iron from brake dust, PAHs, may also exacerbate the low dissolved oxygen impairment through increased water temperatures and stimulation of microorganism growth. Discharges of bacterial pathogens from sanitary waste during construction may exacerbate the E. coli and fecal coliform impairments. Work in and near Pajaro River during construction, vegetation management, bridge/culvert maintenance, and discharges from brake dust, PAHs, may exacerbate the turbidity and sedimentation impairments. Accidental discharges of any pollutant may exacerbate the toxicity impairment. Construction site BMPs would avoid or minimize the potential for discharging sanitary waste, sediment, and accidental discharges. Construction of the concrete viaduct structures may temporarily contribute to elevated pH.	Same as Alternative 1.	The project would construct a new viaduct crossing over Pajaro River without piers within the channel, a new high-voltage utility crossing, and a new crossing at Lake Road. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossings would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near Pajaro River, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains. Leaks of pesticides from vegetation management during construction and operations may result in discharges of pesticides to Pajaro River. Vegetation management, reduced shading over Pajaro River, and discharges of iron from brake dust, PAHs, may also exacerbate the low dissolved oxygen impairment through increased water temperatures and stimulation of microorganism growth. Discharges of bacterial pathogens from sanitary waste during construction may exacerbate the E. coli and fecal coliform impairments. Work in and near Pajaro River during construction, vegetation management, bridge/culvert maintenance, and discharges from brake dust, PAHs, may exacerbate the turbidity and sedimentation impairments. Accidental discharges of any pollutant may exacerbate the toxicity impairment. Construction site BMPs would avoid or minimize the potential for discharging sanitary waste, sediment, and accidental discharges. Construction of the concrete viaduct structures may temporarily contribute to elevated pH.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 133	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Constructed Watercourse 133 due to construction of a new high-voltage utility crossing. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Constructed Watercourse 133.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
Constructed Watercourse 13	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Constructed Watercourse 13 because it is within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Constructed Watercourse 13.	Same as Alternative 1.	Same as Alternative 1.	The project would result in minor disturbances to Constructed Watercourse 13 to construct a new high-voltage utility crossing. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Constructed Watercourse 13.
Seasonal Wetland 4	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would partially fill Seasonal Wetland 4 for the Bloomfield Avenue grade separation, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would avoid Seasonal Wetland 4.	Same as Alternative 1.	The project would have no impact on Seasonal Wetland 4 because it is not within the footprint of Alternative 3.	Same as Alternative 3.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Uvas-Carnadero Creek	Central Coast	Uvas Creek: MUN, AGR, IND, GWR, REC-1, REC-2, WILD, COLD, WARM, MIGR, SPWN, RARE, COMM Carnadero Creek: MUN, GWR, REC-1, REC-2, WILD, COLD, MIGR, RARE, COMM	Uvas Creek: low dissolved oxygen, turbidity Carnadero Creek: E. coli, fecal coliform, low dissolved oxygen, nitrate, turbidity	Table 3-1, Table 3-2, Table 3-5 Dissolved oxygen: shall not be reduced below 7.0 milligrams per liter Fecal coliform[1, 2] pH: 7.0 minimum, 8.3 maximum Phenol: 1.0 microgram per liter maximum Temperature: 5 degrees Fahrenheit increase maximum Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum	The project would result in minor disturbances to Uvas Creek to construct a new roadway crossing along relocated Bloomfield Avenue without columns inside the channel. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would avoid Uvas Creek. Vegetation management during construction may exacerbate the low dissolved oxygen impairment from reduced shading. Work in and near Uvas Creek during construction may exacerbate the turbidity impairment. However, construction site BMPs would avoid or minimize discharges of sediment from the construction site.	Same as Alternative 1.	The project would have no impact on Uvas Creek because it is not within the footprint of Alternative 3.	Same as Alternative 3.
Uvas-Carnadero Creek Palustrine Forested Wetlands	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would construct a new roadway crossing along relocated Bloomfield Avenue with piers in the wetland, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would avoid Uvas-Carnadero Creek Palustrine Forested Wetlands.	Same as Alternative 1.	The project would have no impact on Uvas-Carnadero Creek Palustrine Forested Wetlands because it is not within the footprint of Alternative 3.	Same as Alternative 3.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 14	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would relocate Constructed Watercourse 14 along the toe of the embankment for the Bloomfield Avenue grade separation, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would avoid Uvas-Carnadero Creek Palustrine Forested Wetlands. Operations would avoid Constructed Watercourse 14.	Same as Alternative 1.	The project would have no impact on Constructed Watercourse 14 because it is not within the footprint of Alternative 3.	Same as Alternative 3.
Palustrine Forested Wetland 8	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would partially fill Palustrine Forested Wetland 8 for the Bloomfield Avenue grade separation, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the wetland, such as vegetation management.	Same as Alternative 1.	The project would have no impact on Palustrine Forested Wetland 8 because it is not within the footprint of Alternative 3.	Same as Alternative 3.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 135	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would fill Constructed Watercourse 135 within the proposed HSR right-of-way, requiring temporary stream diversion, dewatering, and work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the embankment would also change the path, speed, and volume of existing discharges and flows. Operations would avoid the watercourse.	Same as Alternative 1.	The project would have no impact on Constructed Watercourse 135 because it is not within the footprint of Alternative 3.	The project would fill the watercourse within the limits of the South Gilroy MOWF or relocate the waterbody to be outside the proposed South Gilroy MOWF. This work would require temporary stream diversion, dewatering, and work in the waterbody, which may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the MOWF would also change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.
Constructed Watercourse 15	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Constructed Wetland 15 because it is within temporary construction easements. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the wetland.	Same as Alternative 1.	Same as Alternative 1.	The project would result in minor disturbances to Constructed Watercourse 15 to construct a new high-voltage utility crossing. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Constructed Watercourse 15.
Seasonal Wetland 5	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Seasonal Wetland 5 because it is not within the footprint of Alternative 1.	Same as Alternative 1.	Same as Alternative 1.	The project would result in minor disturbances to Seasonal Wetland 5 because it is within the existing Hollister Freight Branch railroad right-of-way. This work may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in or near the wetland, such as vegetation management.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 16	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would construct new culverts and relocate a portion of Constructed Watercourse 16, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near Constructed Watercourse 16, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	The project would have no impact on Constructed Watercourse 16 because it is not within the footprint of Alternative 3.	The project would relocate a portion of Constructed Watercourse 16 and cross the South Gilroy MOWF in a new culvert, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near Constructed Watercourse 16, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.
Pajaro River Palustrine Forested Wetlands	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would construct a new viaduct crossing over Pajaro River Palustrine Forested Wetlands with piers in the wetland, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near Pajaro River Palustrine Forested Wetlands, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	The project would have no impact on Pajaro River Palustrine Forested Wetlands because it is not within the footprint of Alternative 3.	Same as Alternative 1.
Constructed Watercourse 157 and 158	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to the watercourses because they are located within a temporary constructed easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourses.	Same as Alternative 1.	The project would result in minor disturbances to the watercourses due to the construction of a new high-voltage utility crossing. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourses.	Same as Alternative 3.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 159	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Constructed Watercourse 159 watercourses due to the construction of a new high-voltage utility crossing. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
Constructed Watercourse 17	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would relocate Constructed Watercourse 17 around a proposed viaduct pier, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near Constructed Watercourse 17, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	The project would have no impact on Constructed Watercourse 17 because it is not within the footprint of Alternative 3.	Same as Alternative 1.
Constructed Watercourse 18	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Constructed Watercourse 18 because it is within a staging area. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Constructed Watercourse 18.	Same as Alternative 1.	The project would have no impact on Constructed Watercourse 18 because it is not within the footprint of Alternative 3.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 19	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Constructed Watercourse 19 because it is within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Constructed Watercourse 19.	Same as Alternative 1.	The project would have no impact on Constructed Watercourse 19 because it is not within the footprint of Alternative 3.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Millers Canal	Central Coast	None designated in the Basin Plan	Chlorophyll-a, E. coli, fecal coliform, low dissolved oxygen, nitrate, pH, temperature, toxicity, turbidity	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would construct a new viaduct crossing with a pier inside the channel banks, requiring temporary stream diversion and dewatering, and a new utility crossing over Millers Canal. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near Millers Canal, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains. Reduced shading over Millers Canal from vegetation management and discharges of iron from brake dust, PAHs, may exacerbate the low dissolved oxygen impairment through increased water temperatures and stimulation of microorganism growth. Discharges of bacterial pathogens from sanitary waste during construction may exacerbate the fecal coliform impairment. Construction near or in Millers Canal, vegetation management during construction and operations, and discharges of brake dust, PAHs, and other contaminants from trains may exacerbate the turbidity impairment. Construction site BMPs would avoid or minimize the potential for discharging sanitary waste and sediment during the construction phase. Construction of the concrete viaduct structure may temporarily exacerbate the pH impairment.	Same as Alternative 1.	The project would construct a new viaduct crossing, a new culvert or bridge requiring temporary stream diversion and dewatering, and a new high-voltage utility crossing over Millers Canal. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near Millers Canal, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains. Reduced shading over Millers Canal from vegetation management and discharges of iron from brake dust, PAHs, may exacerbate the low dissolved oxygen impairment through increased water temperatures and stimulation of microorganism growth. Discharges of bacterial pathogens from sanitary waste during construction may exacerbate the fecal coliform impairment. Construction near or in Millers Canal, vegetation management during construction and operations, and discharges of brake dust, PAHs, and other contaminants from trains may exacerbate the turbidity impairment. Construction site BMPs would avoid or minimize the potential for discharging sanitary waste and sediment during the construction phase.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 134	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Constructed Watercourse 134 because it is not within the footprint of Alternative 1.	Same as Alternative 1.	The project would construct a viaduct over the watercourse and relocate the watercourse to cross below the viaduct at a perpendicular angle, requiring temporary stream diversion, dewatering, and work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Grading to relocate the channel would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.
Constructed Watercourse 136	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Constructed Watercourse 136 because it is not within the footprint of Alternative 1.	Same as Alternative 1.	The project would construct a viaduct over the watercourse and relocate the watercourse to flow around a viaduct pier, requiring temporary stream diversion, dewatering, and work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Grading to relocate the channel would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 137	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would construct a viaduct over the watercourse and relocate the watercourse to flow around a viaduct pier, requiring temporary stream diversion, dewatering, and work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Grading to relocate the channel would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	The project would result in minor disturbances to Constructed Watercourse 137 due to construction of a new high-voltage utility line. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Constructed Watercourse 137.	Same as Alternative 1.
Constructed Watercourse 20, 21, and 22	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would build a viaduct over Constructed Watercourse 20, 21, and 22 and relocate the watercourses around proposed viaduct piers, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near watercourses, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	The project would have no impact on the watercourses because they are not within the footprint of Alternative 3.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 23	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would build a viaduct over Constructed Watercourse 23, relocate the watercourse around a proposed viaduct pier, which would require temporary stream diversion and dewatering, and build a new high-voltage utility crossing. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near Constructed Watercourse 23, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	The project would result in minor disturbances to Constructed Watercourse 23 due to construction of a new high-voltage utility crossing. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Constructed Watercourse 12.	Same as Alternative 1.
Marsh 2	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would have no impact on Marsh 2 because it is not within the footprint of Alternative 1.	Same as Alternative 1.	The project would partially fill Marsh 2 for improvements along Lake Road, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would avoid Marsh 2.	Same as Alternative 1.

These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near Constructed Watercourse 30, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Seasonal Wetland 9	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would construct a new utility crossing over Seasonal Wetland 9, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Seasonal Wetland 9.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
Ortega Creek	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would install temporary roadway crossings within the creek during construction, requiring work in the waterbody, and construct four new high-voltage utility crossings over Ortega Creek. This work may potentially result in erosion or discharge of polluted runoff. Groundwater inflows during tunnel construction may affect the hydrology of Ortega Creek's tributaries, resulting in altered stream flows in Ortega Creek. Project features require constructing and designing the tunnels to be as watertight as possible and controlling discharges of contaminated groundwater; however, these actions are not anticipated to avoid the impact from tunnel construction entirely. Operations would avoid the creek.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
Seasonal Wetland 10	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Seasonal Wetland 10 because it is within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the wetland.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Ortega Creek Tributary 1	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Ortega Creek Tributary 1 because it is within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the creek.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
Ortega Creek Tributary 2	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Ortega Creek Tributary 2 during construction of a new high-voltage utility crossing. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the creek.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
Ortega Creek Tributary 3	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Ortega Creek Tributary 3 because it is within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the creek.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Ortega Creek Tributary 4	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would temporarily impact the hydrology of Ortega Creek Tributary 4 from tunnel construction. Groundwater inflows during tunnel construction may affect the hydrology of Ortega Creek Tributary 4 through a lowering of the groundwater table. Project features require constructing and designing the tunnels to be as watertight as possible and controlling discharges of contaminated groundwater; however, these actions are not anticipated to avoid the impact from tunnel construction entirely. Operations would avoid the waterbody.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
Ortega Creek Tributary 5	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would temporarily impact the hydrology of Ortega Creek Tributary 5 from tunnel construction. Groundwater inflows during tunnel construction may affect the hydrology of Ortega Creek Tributary 5 through a lowering of the groundwater table. Project features require constructing and designing the tunnels to be as watertight as possible and controlling discharges of contaminated groundwater; however, these actions are not anticipated to avoid the impact from tunnel construction entirely. Additionally, the project may permanently modify the creek to minimize landslide risk, depending on the final grading plan. Permanent modifications to the waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody, and it would require work to be performed within the waterbody. This work may potentially result in erosion or discharge of polluted runoff, and the modifications may affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near Ortega Creek Tributary 5, such as vegetation management, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Ortega Creek Tributary 6	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would permanently modify Ortega Creek Tributary 6 due to earthwork required to minimize landslide risk, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near Ortega Creek Tributary 6, such as vegetation management, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
Ortega Creek Tributary 7	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Ortega Creek Tributary 7 because it is within a staging area. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the creek.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
Ortega Creek Tributary 8, 9, 10, and 11	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would permanently modify these creeks due to earthwork required to minimize landslide risk, requiring work in the waterbodies. This work may potentially result in erosion or discharge of polluted runoff. Modifications to these waterbodies would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creeks, such as vegetation management.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Pond 6	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would permanently modify Pond 6 due to earthwork required to minimize landslide risk, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near Pond 6, such as vegetation management.			
Pacheco Creek Tributary 9	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would construct a new culvert within Pacheco Creek Tributary 9, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent activities in or near the creek, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Pacheco Creek Tributary 10	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would permanently modify Pacheco Creek Tributary 10 due to earthwork required to minimize landslide risk, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent activities in or near the creek, such as vegetation management.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Carmen Creek and Carmen Creek Tributary 1	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would install one temporary roadway crossing, requiring work in the waterbody, and a new high-voltage utility line over the creek. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Carmen Creek.			
Pacheco Creek Tributary 33, 34, 35, 36, 38, 39, and 40	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would permanently modify these creeks due to earthwork required to minimize landslide risk, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent activities in or near the creeks, such as vegetation management. Operations would also result in continuous discharges of brake dust, PAHs, and other contaminants from trains into Pacheco Creek Tributary 38.			
Pacheco Creek Tributary 37 and 41	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Pacheco Creek Tributary 37 and 41 because they are located within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid these creeks.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Pond 7, 8, and 9	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would permanently modify Pond 7, 8, and 9 due to earthwork required to minimize landslide risk, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would avoid these ponds.			
Pacheco Creek Tributary 42	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Pacheco Creek Tributary 42 because it is located within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the creek.			
Pacheco Creek Tributary 11 and 12	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would install temporary roadway crossings, requiring work in the waterbodies, and a new high-voltage utility line over the creeks. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Pacheco Creek Tributary 11 and 12.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Pacheco Creek Tributary 13 and 14	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would construct new culverts within Pacheco Creek Tributary 13 and 14, requiring work in the waterbodies. This work may potentially result in erosion or discharge of polluted runoff. Modifications to these waterbodies would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbodies. Operations would include intermittent work in or near the creeks, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Pacheco Creek Tributary 15	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Pacheco Creek Tributary 15 because it is within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the waterbody.			
Pacheco Creek Tributary 16	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would construct a new culvert in the creek, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the waterbody, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 139	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to the watercourse during construction of a new high-voltage utility line over the creek. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse.			
Elephant Head Creek	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would install a temporary roadway crossing, requiring work in the waterbody, and a new high-voltage utility line over the creek. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid Elephant Head Creek.			
Elephant Head Creek Tributary 1	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to the creek during construction of a new high-voltage utility line over the creek. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 140 and 141	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to the watercourses during construction of a new high-voltage utility line over their channels. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourses.			
Constructed Watercourse 142	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to the watercourse during construction of a viaduct near the channel. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse. Operations would include intermittent work in or near the watercourse, such as vegetation management, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 143	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would install a new culvert in the watercourse for a proposed access road, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the waterbody, such as vegetation management and culvert maintenance.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Pacheco Creek Tributary 17	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to the creek during construction of a new high-voltage utility line over the creek. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the creek.			
Marsh 7	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to the marsh because it is located within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the marsh.			
Pacheco Creek Tributary 43 and 44	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to these creeks from construction of a new high-voltage utility line over the creeks. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the creeks.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Harper Canyon Creek	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Harper Canyon Creek to construct a new viaduct crossing without piers inside the channel and new utility crossings. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the creek, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Harper Canyon Creek Tributary 1	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Harper Canyon Creek Tributary 1 because it is located within a staging area near the western portal of Tunnel 2. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the creek.			
Harper Canyon Creek Tributary 2	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would result in minor disturbances to Harper Canyon Creek Tributary 2 due to nearby earthwork associated with minimizing the risk of landslides and construction of the tunnel portal. This work may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in or near the creek, such as vegetation management.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Harper Canyon Creek Tributary 3	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would permanently modify the creek due to earthwork to construct the western portal of Tunnel 2 and install a culvert at the proposed portal, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the waterbody, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Harper Canyon Creek Tributary 4	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would construct a viaduct over the creek, relocate the creek to flow around a viaduct pier, and install a culvert at a proposed access road, all of which would require work in the creek. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creek, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Pacheco Creek Tributary 19	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	Although the creek is located within the project footprint, it would be avoided by construction activities. Operations would include intermittent work in or near the creek, such as vegetation management.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Pond 10 and 11	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	There would be no impact on Pond 10 and 11 during construction, because the pond would be avoided during construction. Operations would include intermittent work in or near the ponds, such as vegetation management.			
Pacheco Creek Tributary 20	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would permanently modify Pacheco Creek Tributary 20 for landslide minimization, requiring work in the creek. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creek, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Pacheco Creek Tributaries 21 – 30, 46 – 55, and 57	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would temporarily impact the hydrology of Pacheco Creek Tributaries 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, and 57 from tunnel construction. Groundwater inflows during tunnel construction may affect the hydrology of these tributaries through a lowering of the groundwater table. Project features require constructing and designing the tunnels to be as watertight as possible and controlling discharges of contaminated groundwater; however, these actions are not anticipated to avoid the impact from tunnel construction entirely. Operations would avoid the waterbodies.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
South Fork Pacheco Creek	Central Coast	None designated in the Basin Plan	None listed.	Dissolved oxygen: shall not be reduced below 5.0 milligrams per liter, median values should not fall below 85% saturation. pH: 7.0 minimum, 8.5 maximum. Turbidity: 20% maximum for natural turbidity between 0 to 50 NTU; 10 NTU change maximum for natural turbidity between 50 to 100 NTU; 10% maximum change for natural turbidity greater than 100 NTU. Unionized ammonia: 0.025 milligrams per liter (as nitrogen) maximum.	The project would temporarily impact the hydrology of South Fork Pacheco Creek from tunnel construction. Groundwater inflows during tunnel construction may affect the hydrology of South Fork Pacheco Creek through a lowering of the groundwater table. Project features require constructing and designing the tunnels to be as watertight as possible and controlling discharges of contaminated groundwater; however, these actions are not anticipated to avoid the impact from tunnel construction entirely. Operations would avoid the waterbody.			
San Luis Reservoir Tributaries 1 – 9	Central Valley	None designated in the Basin Plan. Beneficial uses of San Luis Reservoir apply: MUN, AGR, IND, POW, REC-1, REC-2, WILD, WARM	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would temporarily impact the hydrology of San Luis Reservoir Tributaries 1, 2, 3, 4, 5, 6, 7, 8, and 9 from tunnel construction. Groundwater inflows during tunnel construction may affect the hydrology of these waterbodies through a lowering of the groundwater table, which also may indirectly affect the hydrology of San Luis Reservoir. Project features require constructing and designing the tunnels to be as watertight as possible and controlling discharges of contaminated groundwater; however, these actions are not anticipated to avoid the impact from tunnel construction entirely. Operations would avoid the waterbodies.			
Cottonwood Creek and Tributaries 1 – 16	Central Valley	Beneficial uses of San Luis Reservoir apply: MUN, AGR, IND, POW, REC-1, REC-2, WILD, WARM	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would temporarily impact the hydrology of Cottonwood Creek and tributaries 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, and 16 from tunnel construction. Groundwater inflows during tunnel construction may affect the hydrology of Cottonwood Creek through a lowering of the groundwater table. Project features require constructing and designing the tunnels to be as watertight as possible and controlling discharges of contaminated groundwater; however, these actions are not anticipated to avoid the impact from tunnel construction entirely. Operations would avoid the waterbody.			
Romero Creek Tributary 1	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would involve the construction of a new tunnel crossing at Romero Creek Tributary 1, which may temporarily impact the hydrology of the creek from a lowering of the groundwater table. Project features require constructing and designing the tunnels to be as watertight as possible and controlling discharges of contaminated groundwater; however, these actions are not anticipated to avoid the impact from tunnel construction entirely. The project would also result in minor disturbances to the creek because it is within a temporary construction easement, which may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in or near the creek, such as vegetation management.			
Romero Creek	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a viaduct with a pier in the creek and a new utility crossing over Romero Creek. The project would also partially fill the creek and install a new culvert for an HSR access road, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. The project would also temporarily and indirectly impact the hydrology of Romero Creek from tunnel construction. This would occur because surface flows in Romero Creek Tributary 1 may be impacted from a lowering of the groundwater table. Project features require constructing and designing the tunnels to be as watertight as possible and controlling discharges of contaminated groundwater; however, these actions are not anticipated to avoid the impact from tunnel construction entirely. Operations would include intermittent work in or near the creek, such as vegetation management and bridge/culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Romero Creek Tributary 2	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new viaduct crossing over Romero Creek Tributary 2 and relocate the channel around a viaduct pier, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creek, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Romero Creek Tributary 3	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would permanently modify Romero Creek Tributary 3 due earthwork required to construct the embankment, requiring work in the waterbody. Additionally, the project would install a culvert in the creek for maintenance access. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creek, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Romero Creek Tributary 4 and 5	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct new culvert in Romero Creek Tributary 4 and 5 for an HSR access road, requiring work in the creeks. This work may potentially result in erosion or discharge of polluted runoff. Modifications to these creeks would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the creeks. These modifications would also affect the path, speed, and volume of existing flows within the creeks. Operations would include intermittent work in or near these creeks, such as culvert maintenance.			
Romero Creek Tributary 6	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new viaduct crossing over Romero Creek Tributary 6. The project would also permanently modify the creek due earthwork required to construct the railbed embankment and install culverts for maintenance access, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the embankment would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the creek, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Romero Creek Tributary 7	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert in Romero Creek Tributary 7 for an HSR access road, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creek, such as culvert maintenance.			
Romero Creek Tributary 8	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new wildlife crossing/culvert at the track embankment within Romero Creek Tributary 8, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creek, such as culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Seasonal Wetland 20 and 21	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would temporarily disturb the wetlands from construction of an HSR access road. This work may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in or near these wetlands, such as culvert maintenance.			
Romero Creek Tributary 10	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert in Romero Creek Tributary 10 for an HSR access road, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creek, such as vegetation management.			
Romero Creek Tributary 11 and 12	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would temporarily disturb these creeks because they are located within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid these creeks.			
Romero Creek Tributary 13	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would permanently modify the creek due to earthwork required to construct the track embankment and install a new culvert for maintenance access, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creek, such as vegetation management.			
Romero Creek Tributary 14	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would permanently modify Romero Creek Tributary 14 due to earthwork required to construct the track embankment, install a new culvert at the track embankment, and install a new culvert for maintenance access, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creek, such as vegetation management, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Romero Creek Tributary 15	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would permanently modify the creek due to earthwork required to construct the track embankment and install a new culvert for maintenance access, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creek, such as vegetation management.			
Romero Creek Tributary 16	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would install a new culvert for maintenance access, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creek, such as vegetation management.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Romero Creek Tributary 17 and 18	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a viaduct over the creeks and install culverts for maintenance access, requiring work in the creeks. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creek, such as vegetation management, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Romero Creek Tributary 19	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would install a new culvert for maintenance access, requiring work in the creek. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creek, such as vegetation management.			
Romero Creek Tributary 20	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would install a new culvert at the track embankment, requiring work in the creek. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creek, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Romero Creek Tributary 21	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would permanently modify the creek due to earthwork required to construct the track embankment and install a new culvert at the embankment, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the creek, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Alkali Vernal Pool Complex 1	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would fill a portion of the vernal pool to construct an HSR access road and install a culvert at the access road, requiring work in the vernal pool. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the access road would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the vernal pool, such as bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Seasonal Wetland 11	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would fill a portion of the wetland to construct an HSR access road and install a culvert at the access road, requiring work in the wetland. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the access road would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the wetland, such as vegetation management and culvert maintenance.			
California Aqueduct	Central Valley	MUN, AGR, PROC, IND, POW, REC-1, REC-2, WILD	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would protect California Aqueduct in place during construction of a viaduct over the channel. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the aqueduct, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Seasonal Wetland 12	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would partially fill Seasonal Wetland 12 for the track embankment, requiring work in the wetland. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Delta-Mendota Canal	Central Valley	MUN, AGR, REC-1, REC-2, WARM, WILD	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would protect Delta-Mendota Canal in place during construction of a viaduct over the channel. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the canal, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 32	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the channel around the embankment to cross below the viaduct, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the canal, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 33	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to Constructed Watercourse 33 because it is located within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the waterbody.			
Outside Canal	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would protect Outside Canal in place during construction of a viaduct over the channel. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the canal, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 34	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate Constructed Watercourse 34 to cross below the proposed viaduct, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 35	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert in Constructed Watercourse 35, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 36	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert in Constructed Watercourse 36, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges to and existing flows within the waterbody. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
San Joaquin Valley Subsection								
Constructed Watercourse 37	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a viaduct crossing over Constructed Watercourse 37and a new culvert within the watercourse, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 38	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a viaduct over the watercourse and relocate a portion of the watercourse, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 145	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would install a culvert in the watercourse for emergency access, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance.			
Constructed Basin 14	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would install a culvert in the basin for emergency access, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this basin would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the basin. These modifications would also affect the path, speed, and volume of existing flows within the basin. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the basin, such as vegetation management and culvert maintenance.			
Constructed Watercourse 39	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the watercourse to flow around a proposed viaduct pier, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 162	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would install a culvert in the watercourse for emergency access, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance.			
Constructed Watercourse 40	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would fill the watercourse within the proposed HSR right-of-way, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Main Canal	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to Main Canal to protect the canal in place during construction of a viaduct without piers inside the channel. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the canal, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Basin 9	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a viaduct over Constructed Basin 9 with piers in the basin, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the basin, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 41	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the watercourse to flow around proposed viaduct piers, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 43	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to Constructed Watercourse 43 because it is located within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the waterbody.			
Constructed Watercourse 44	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert in Constructed Watercourse 44, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 160	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to Constructed Watercourse 160 because it is located within the proposed HSR right-of-way but no improvements are proposed. Operations would include intermittent work in or near the watercourse, such as vegetation management			
Constructed Watercourse 45	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert in Constructed Watercourse 45, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 146	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to Constructed Watercourse 146 because it is located within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse.			
Constructed Watercourse 47	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would extend the existing culvert for the proposed access road, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the access road would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance.			
Constructed Watercourse 48	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert to cross below the embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Grading and fill for the grade separation and farm access road would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 165	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new viaduct over the watercourse and relocate the watercourse around a viaduct pier, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Grading and fill for the grade separation and farm access road would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Alkali Scrub Wetland 1	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would partially fill Alkali Scrub Wetland 1 to construct a proposed access road, requiring work in the wetland. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the access road would also change the path, speed, and volume of existing discharges and flows. Operations would avoid the wetland.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Alkali Scrub Wetland 7	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to the wetland because it is located within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the wetland.			
Natural Watercourse 2	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert to cross below a proposed access road, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the access road would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the waterbody, such as culvert maintenance.			
San Luis Wasteway	Central Valley	AGR (L), WILD (L), WARM, BIOL	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to San Luis Wasteway during construction of a viaduct without piers inside the channel. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Seasonal Wetland 22	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would temporarily disturb the watercourse during construction of a viaduct over the wetland, requiring work in the wetland. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the waterbody, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Alkali Scrub Wetland 2	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new viaduct crossing over Alkali Scrub Wetland 2 and partially fill the wetland for maintenance access, requiring work in the wetland. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the wetland, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Alkali Scrub Wetland 3	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would partially fill Alkali Scrub Wetland 3 for maintenance access, requiring work in the wetland. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the maintenance access road would also change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Seasonal Wetland 23	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a viaduct with a column in the wetland and partially fill the wetland, requiring work in the wetland. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the wetland, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Alkali Scrub Wetland 4	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to Alkali Scrub Wetland 4 because it is located within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the wetland.			
Alkali Scrub Wetland 8	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would partially fill Alkali Scrub Wetland 8 for maintenance access, requiring work in the wetland. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the maintenance access road would also change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Alkali Scrub Wetland 9	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would completely fill this small wetland in order to construct a viaduct pier, requiring work in the wetland. This work may potentially result in erosion or discharge of polluted runoff. This would also cause a depletion of water resources within the project extent. Operations would not affect the wetland.			
Constructed Watercourse 51	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to Constructed Watercourse 51 because it is located within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse.			
Constructed Watercourse 52	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert within Constructed Watercourse 52 and relocate a portion of the channel along the embankment for the Henry Miller Road grade separation, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the embankment would also change the path, speed, and volume of existing discharges and flows. Operations would avoid the watercourse.			
Constructed Watercourse 53	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to Constructed Watercourse 53 because it is located within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse.			
Constructed Watercourse 54	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to the watercourse, because it is located in a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 55	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert where the watercourse crosses the track embankment, a new culvert where the watercourse would cross relocated Henry Miller Road, and relocate a portion of the watercourse, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing and relocated Henry Miller Road would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 56	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct two new culverts in Constructed Watercourse 56, one for the track embankment and one for the driveway to the proposed traction power facility, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 57	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert in Constructed Watercourse 57, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 58	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to the watercourse because it is located in a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse.			
Constructed Watercourse 59	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would completely fill Constructed Watercourse 59 for the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. This would also cause a depletion of water resources within the project extent. Operations would not affect the watercourse.			
Constructed Watercourse 60	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would no impact on Construct Watercourse 60 because it would be protected during construction and operations would avoid the watercourse.			
Constructed Watercourse 61	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert in Constructed Watercourse 61, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 62, 63, 64, and 65	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate these constructed watercourses to the toe of the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to these waterbodies would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new embankment would also change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 66	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate a portion of the watercourse and provide a culvert where it crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 67	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate Constructed Watercourse 67 along the toe of the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 68	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the watercourse around a proposed viaduct pier, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 147	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate Constructed Watercourse 147 along the toe of the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 148	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would completely fill this watercourse to build the track embankment and for maintenance access, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. This would also cause a depletion of water resources within the project extent. Operations would not affect the watercourse.			
Constructed Watercourse 149 and 163	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to these constructed watercourses because they are located within a staging area. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid these waterbodies.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Los Banos Creek	Central Valley	AGR (L), WILD (L), WARM, BIOL	Indicator bacteria, total dissolved solids, low dissolved oxygen, toxicity	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to Los Banos Creek to construct a new viaduct without piers inside the channel and protect the creek in place. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the creek, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains. Reduced shading over Los Banos Creek from vegetation management and discharges of iron from brake dust, PAHs, may exacerbate the low dissolved oxygen impairment through increased water temperatures and increased microorganism growth. Discharges of bacterial pathogens from sanitary waste during construction may exacerbate the indicator bacteria impairment. Accidental discharges of any pollutant may exacerbate the toxicity impairment. Construction site BMPs would avoid or minimize the potential for discharging sanitary waste and accidental leaks and spills during the construction phase.			
Los Banos Creek Tributary 1	Central Valley	AGR (L), WILD (L), WARM, BIOL	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would temporarily disturb the creek because of construction of viaduct footings, requiring work in the waterbody. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the creek, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 69	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the watercourse to flow around a viaduct pier, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 70	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the watercourse to flow around a viaduct pier, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 71	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a viaduct over the watercourse and relocate the watercourse to cross below a proposed access road with a new culvert, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing and access road would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 72	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert to cross below the track embankment and a proposed access road, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing and access road would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Basin 15	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would completely fill this basin to build the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. This would also cause a depletion of water resources within the project extent. Operations would not affect the basin.			
Seasonal Wetland 13	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would partially fill Seasonal Wetland 13 to construct a proposed access road, requiring work in the wetland. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the access road would also change the path, speed, and volume of existing discharges and flows. Operations would avoid the wetland.			
Constructed Watercourse 73	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert where the watercourse crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 76	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert where the watercourse crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 77	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct two new culverts, one where the watercourse crosses the track embankment and one where the watercourse crosses a proposed access road, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing and access road would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in or near the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 78	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the watercourse to the south side of the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would avoid the watercourse.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 79 and 80	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the watercourses to the south side of the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to these waterbodies would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 81	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to Constructed Watercourse 81 because it is located within a utility temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse.			
Constructed Watercourse 82	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would install a temporary culvert for a temporary detour at the Mercy Springs grade separation, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the grade separation road would change the path, speed, and volume of existing discharges and flows. Operations would avoid the watercourse.			
Santa Fe Canal	Central Valley	AGR (L), WILD (L), WARM, BIOL	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new reinforced concrete box culvert where the canal crosses the rail embankment and install a temporary culvert for a temporary detour at the Mercy Springs grade separation, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the canal, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Vernal Pool 4	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would fill a majority of Vernal Pool 4 for the track embankment and a proposed access road, requiring work in the vernal pool. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the area and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing and access road would also change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 84	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to Constructed Watercourse 84 because it is located within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse.			
San Luis Drain	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new reinforced concrete box culvert where the drain crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the canal, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
San Luis Canal	Central Valley	AGR (L), WILD (L), WARM, BIOL	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new reinforced concrete box culvert where the canal crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the canal, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Porter-Blake Bypass	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate a portion of the canal and construct a new culvert where the canal crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the canal, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 85 and 86	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the watercourses south of the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges to and existing flows within the waterbody. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Mud Slough Alkali Marshes	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a viaduct with piers in the marshes, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the marshes, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Mud Slough, Mud Slough Alkali Marshes, and Alkali Scrub Wetland 10, 11, 12, and 13	Central Valley	AGR (L), REC-1, REC-2, WILD, WARM, SPWN, COMM, SHELL	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a viaduct that crosses over Mud Slough and adjacent wetlands with piers in the waterbodies, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the waterbodies, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 87	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate Constructed Watercourse 87 around a proposed viaduct pier, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 88	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate Constructed Watercourse 88 around a proposed viaduct pier, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
San Pedro Canal	Central Valley	AGR (L), WILD (L), WARM, BIOL	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to San Pedro Canal during construction of a viaduct without piers inside the channel. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around San Pedro Canal, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 89	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate Constructed Watercourse 89 around a proposed viaduct pier, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 90	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to the watercourse because it is located within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse.			
Constructed Watercourse 164	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to the watercourse because it is located within a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse.			
Boundary Drain	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to Boundary Drain during construction of a viaduct without piers inside the channel. This work may potentially result in erosion or discharge of polluted runoff. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around Boundary Drain, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Lone Tree Canal	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new 4-foot by 3-foot reinforced concrete box culvert to cross the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the canal, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Devon Drain	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new 6-foot by 4-foot reinforced concrete box culvert to cross the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the canal, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 92	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert in Constructed Watercourse 92 and fill a portion of the watercourse for the proposed Delta Road grade separation, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the proposed grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would avoid the watercourse.			
Constructed Watercourse 93	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the channel to the west of the Delta Road grade separation and provide a culvert to cross the Delta Road to Henry Miller Road connector, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the proposed grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would avoid the watercourse.			
Midway Swamp Ditch	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would install a temporary culvert in Midway Swamp Ditch for a temporary roadway required to construct the Delta Road grade separation. Additionally, the project would install a new 48-inch reinforced concrete pipe culvert where the ditch crosses the track embankment and relocate a portion of the ditch south of Henry Miller Road along the toe of the Delta Road embankment. Temporary stream diversion and dewatering is required. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the ditch, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 94, 95, 96, and 97	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to these watercourses because they are located in a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid these watercourses.			
Constructed Watercourse 98	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a culvert within Constructed Watercourse 98 to cross a proposed access road and relocate the channel to flow into relocated Midway Swamp Ditch, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the proposed access road would also change the path, speed, and volume of existing discharges and flows. Operations would avoid the watercourse.			
Constructed Watercourse 150	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would install a culvert in Constructed Watercourse 150 to cross the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the watercourse, such as vegetation management and bridge maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 99	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to the watercourse because it is located in a temporary construct easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in and around the watercourse, such as vegetation management and bridge maintenance.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 100	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would install a new culvert where Constructed Watercourse 100 crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
West Delta Canal	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate a portion of the canal on the south side of Henry Miller Road and extend the existing culvert where the canal crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in and around the canal, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
West Delta Drain	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate a portion of the canal on the south side of Henry Miller Road and install a new 7-foot by 3-foot reinforced concrete box culvert where the canal crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in and around the canal, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 151	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would fill the watercourse within the proposed HSR right-of-way, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 152	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would install a culvert where the watercourse crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in and around the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 101	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the watercourse to maintain connectivity with relocated West Delta Drain, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would avoid the watercourse.			
Dambrosa Branch No. 1	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new reinforced concrete box culvert for Dambrosa Branch No. 1 where it crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in and around the canal, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 102	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to Constructed Watercourse 102 because it is located in a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse.			
Constructed Watercourse 103	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate a portion of the watercourse to flow along the south side of the MOWS and construct a new culvert for the watercourse to cross the MOWS and track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing and MOWS would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 104	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the watercourse to maintain connectivity with relocated Constructed Watercourse 103, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Delta Canal	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would install a temporary culvert for the construction of the Turner Island Road grade separation and construct a new culvert where Delta Canal crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the proposed grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the canal, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 105	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert where Constructed Watercourse 105 crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Operations would include intermittent work in and around the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
East Delta Canal	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new reinforced concrete box culvert where East Delta Canal crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the canal, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 107	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert where Constructed Watercourse 107 crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 108	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would fill the watercourse for the track embankment and relocate the watercourse to connect with Constructed Watercourse 109 on the south side of the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 109	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the watercourse to the south of the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 110, 111, 112, and 113	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert these watercourses cross the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to these watercourses would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbodies. These modifications would also affect the path, speed, and volume of existing flows within these watercourses. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around these watercourses, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 114	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the watercourse to the west of the Turner Island Road grade separation, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would avoid the watercourse.			
Belmont Drain	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	During construction of the Turner Island Road grade separation, a temporary culvert in Belmont Drain would be provided for a temporary roadway detour. The project would construct a new culvert where Belmont Drain crosses the track embankment and two new culverts where Belmont Drain crosses the Turner Island Road grade separation. Temporary stream diversion and dewatering is required. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing and grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the canal, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
County Road Ditch	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	During construction of the Turner Island Road grade separation, a temporary culvert in County Road Ditch would be provided for a temporary roadway detour. The project would relocate the channel west of the Turner Island Road grade separation. Temporary stream diversion and dewatering is required. Temporary stream diversion and dewatering is required. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the grade separation would also change the path, speed, and volume of existing. Operations would avoid County Road Ditch.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Willis Branch	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	During construction of the Turner Island Road grade separation, a temporary culvert would be provided for a temporary roadway detour. The project would also relocate the Willis Branch to the west of the Turner Island Road grade separation and install new culverts to cross the track embankment. Temporary stream diversion and dewatering is required. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing and grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the canal, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 153	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate or fill the watercourse for the Turner Island Road grade separation, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing and grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would avoid the watercourse.			
Poso Drain	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the canal to the east side of the Turner Island Road grade separation and install a new culvert to pass below track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing and grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the drain, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 115	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the watercourse to the east side of the Turner Island Road grade separation and construct a new culvert for a proposed farm access road, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new access road and grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would avoid the watercourse.			
Constructed Watercourse 116	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the watercourse to the north of the proposed HSR right-of-way, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new access road and grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 117	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to Constructed Watercourse 117. This work may potentially result in erosion or discharge of polluted runoff. Operations would include intermittent work in and around the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 118	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert where the watercourse crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Delta No. 1 Canal	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new culvert where the canal crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the canal, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 154	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would fill the watercourse within the proposed HSR right-of-way, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing and grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 155	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would install a new culvert in the watercourse at the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the watercourse, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
Constructed Watercourse 119	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would fill the watercourse within the proposed HSR right-of-way, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing and grade separation would also change the path, speed, and volume of existing discharges and flows. Operations would result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
San Juan Drain	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would construct a new reinforced concrete box culvert in San Juan Drain where it crosses the track embankment and a new culvert where it crosses the intersection of Carlucci Road and relocated Hutchins Road, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would include intermittent work in and around the canal, such as vegetation management and culvert maintenance, as well as result in continuous discharges of brake dust, PAHs, and other contaminants from trains.			
West San Juan No. 1 Canal	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would protect the existing culvert and construct a new culvert where it crosses the track embankment, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the new crossing would also change the path, speed, and volume of existing discharges and flows. Operations would avoid the canal.			

Waterbody	RWQCB	Existing Beneficial Uses	CWA Section 303(d) List Impairments	Water Quality Objectives (tables referenced are in the RWQCBs' Basin Plans)	Alternative 1 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 2 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 3 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives	Alternative 4 Impacts to Beneficial Uses, Listed Impairments, and Water Quality Objectives
Constructed Watercourse 120	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would fill a portion of the watercourse for a retaining wall along the northern edge of the Carlucci Road embankment on the south side of Henry Miller Road, requiring temporary stream diversion and dewatering. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the retaining wall would also change the path, speed, and volume of existing discharges and flows. Operations would avoid the watercourse.			
Constructed Watercourse 121	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would relocate the channel around the proposed relocation of Hutchins Road to outfall into San Juan Drain. The project would also construct a new culvert at the watercourse to maintain connectivity with Constructed Watercourse 120 below Hutchins Road. Temporary stream diversion and dewatering is required. This work may potentially result in erosion or discharge of polluted runoff. Modifications to this waterbody would change the channel length and slopes, affecting the path, speed, and volume of existing discharges into the waterbody. These modifications would also affect the path, speed, and volume of existing flows within the waterbody. Grading and fill for the relocated Hutchins Road would also change the path, speed, and volume of existing discharges to and existing flows within the waterbody. Operations would avoid Constructed Watercourse 121.			
Constructed Watercourse 123	Central Valley	None designated in the Basin Plan	None listed.	Dissolved oxygen: 5.0 milligrams per liter minimum. pH: 6.5 minimum, 8.5 maximum. Temperature: 5 degrees Fahrenheit change maximum. Turbidity: maximum change based on natural levels.	The project would result in minor disturbances to Constructed Watercourse 123, because it is located in a temporary construction easement. This work may potentially result in erosion or discharge of polluted runoff. Operations would avoid the watercourse.			

CDFW = California Department of Fish and Wildlife
CWA = Clean Water Act
BMP = best management practices
PPDG = Caltrans' Project Planning and Design Guide
NTU = Nephelometric Turbidity Units
RWQCB = Regional Water Quality Control Board
SWRCB = California State Water Resources Control Board
Authority = California High-Speed Rail Authority
MOWF = Maintenance of Way Facility
PAH = polycyclic aromatic hydrocarbons
AGR = agricultural supply; BIOL = preservation of biological habitats of special significance; COLD = cold freshwater habitat; COMM = commercial and sport fishing; FRSH = freshwater replenishment; GWR = groundwater recharge; IND = industrial service supply; (L) = limited beneficial use; MIGR = fish migration; MUN = municipal and domestic supply; POW = hydropower generation; PROC = industrial process supply; RARE = preservation of rare, threatened, or endangered species; REC-1 = water contact recreation; REC-2 = noncontact water recreation; SPWN = fish spawning, reproduction or early development; WARM = warm freshwater habitat; WILD = wildlife habitat
Waterbodies are listed from north to south along the project alignment.
Narrative water quality objectives in the jurisdictional RWQCB Basin Plans also apply to each waterbody unless otherwise specified in the Basin Plan; refer to EIR/EIS Volume 1, Section 3.8, Hydrology and Water Resources, for a list of narrative water quality objectives.
1 = Fecal coliform concentration based on a minimum of not less than five samples for any 30-day period shall not exceed a geometric mean of 200/100 ml, nor shall more than 10% of the total number of samples taken during any 30-day period exceed 400/100 ml.
2 = Fecal coliform concentration based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 2000/100 ml, nor shall more than 10% of samples collected during any 30-day period exceed 4000/100 ml.
3 = Hard water is defined as water exceeding 100 milligrams per liter calcium carbonate (CaCO3).

[1] The total number of incidences can include reported incidences that did not result in property damages or casualties.
[2] Incidents in which a train struck a vehicle involving no injuries or fatalities are listed in table as "property damage only."
[3] The FRA does not report injury or fatality data for suicides/suicide attempts, and as a result, the number of casualties is unknown. These incidents are listed in the table as "not reported" and the values for casualties, including deaths or injuries, are listed as "–," because the occurrence or numbers of casualties related to these incidents are unknown.
None of the accidents listed above occurred within 0.5 mile of the project alternatives' centerlines.

Alternative 4	Signal	Signal Overcrossing	HSR	
All alternatives	Bridge	Curtner Avenue Overhead (San Jose Overhead UPRR)	Local Jurisdiction	Not applicable; would be rebuilt over[3]
All alternatives	Bridge	American Dairy Pedestrian Bridge	Local Jurisdiction	Not applicable; would be rebuilt over[4]
Alternative 4	Signal	Signal Overbridge	HSR	
All alternatives	Bridge	Capitol Expressway Overhead	Local Jurisdiction	24 ft 6 in
All alternatives	Bridge	Blossom Hill Road Overhead	Local Jurisdiction	24 ft 6 in
All alternatives	Bridge	Xander's Crossing Pedestrian Bridge	Local Jurisdiction	24 ft 6 in
Alternative 4	Bridge	Pedestrian Overpass	Local Jurisdiction	24 ft 6 in
All alternatives	Bridge	SR 85: 37 0488L&R – Coyote Overhead	Caltrans	24 ft 6 in

Alternative	Facility Type	High-Risk Facility Location	Ownership of Facility	Height of Structure[1]
All alternatives	Bridge	SR 85: 37 0634F – Route 101-85/S101 HOV Connector	Caltrans	24 ft 6 in
All alternatives	Bridge	Bernal Road Overhead	Local Jurisdiction	24 ft 6 in
Morgan Hill and Gilroy Subsection				
Alternative 4	Tower	Power Plant, Coyote	Private Sector	100 ft (estimate)
All alternatives	Bridge	Bailey Avenue Overhead	City of San Jose	24 ft 6 in
Alternative 4	Silos	Industrial Facility, Morgan Hill	Private Sector	100 ft (estimate)
Alternatives 2 & 4	Bridge	Butterfield Blvd Overhead	Local Jurisdiction	24 ft 6 in
Alternative 4	Silo	Industrial Plant, Gilroy	Private Sector	25 ft (estimate)
Alternative 4	Bridge	El Camino Real Overcrossing	Local Jurisdiction	24 ft 6 in
Alternatives 1 & 2	Bridge	South Gilroy (US 101) Overhead	Caltrans	Not applicable; would be rebuilt over[3]
Pacheco Pass Subsection				
None				
San Joaquin Valley Subsection				
None				

ft = feet
in = inches
I- = Interstate
UPRR = Union Pacific Railroad
SR = State Route
US = U.S. Highway
HOV = high-occupancy vehicle
Caltrans = California Department of Transportation
US = U.S. Highway
[1] Distance from soffit to top of rail
[2] Existing bridge would be replaced with an underpass.
[3] Existing bridge has insufficient clearance and would be reconstructed to design height standards.
[4] Existing bridge would be replaced with a roadway bridge at the same location.

APPENDIX 3.11-B: AIRPORT OBSTRUCTIONS

APPENDIX 3.11-B: AIRPORT OBSTRUCTIONS

Introduction

Since publication of the Draft Environmental Impact Report/Environmental Impact Statement, the following substantive changes have been made to this appendix:

- Text was updated throughout this appendix to address comments on Federal Aviation Regulation (FAR) 14 Code of Federal Regulations (C.F.R.) Part 77.

Under the California Environmental Quality Act (CEQA) Guidelines, Appendix G (California Code of Regulations [Cal. Code. Regs.], tit. 14, Ch. 3, §§ 15000–15837) the following significance criterion applies to the California High-Speed Rail (HSR) Project:

> For a project located within an airport land use plan or where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Safety hazards can include the development of land uses that are incompatible with airport operations or result in the imposition of airspace obstacles that represent hazards to aviation, and subsequently to people on the ground in areas exposed to aircraft overflight. The purpose of this appendix is to evaluate whether the San Jose to Central Valley Wye Project Extent (project) alternatives impinge upon the FAR Part 77 imaginary airspace surfaces or airport impact areas for any airports in the project vicinity, thus constituting a potential impact under CEQA.

Four public or public-use airports and three heliports are located in the project vicinity. These airports and heliports are described in greater detail in the following sections. No privately operated airstrips were identified within 2 miles of the project alternatives' footprints.

Norman Y. Mineta San Jose International Airport

Norman Y. Mineta San Jose International Airport is an air carrier airport owned by the City of San Jose. The airport is located approximately 1.5 miles from downtown San Jose and approximately 0.3 mile from the project alternatives' footprints at an elevation of 62 feet above mean sea level (ASML), and covers approximately 1,050 acres. The airport operates three parallel runways—Runway 12L-30R, Runway 12R-30L, and Runway 11-29. Traffic at the airport was forecast to increase from a recorded 188,462 operations in 2006 to a projected 330,000 operations by 2017. The 2017 estimate of 330,000 operations was extended to 2027 in the November 2015 update to the Airport Comprehensive Land Use Plan. (County of Santa Clara 2016a).

San Martin Airport

San Martin Airport is a general aviation airport owned by the County of Santa Clara. The airport is located approximately 0.25 mile from the project alternatives' footprints. The airport operates one 3,100-foot-long runway (Runway 14-32) and is forecast to increase from an estimated 56,000 operations in 2002 to 175,560 operations by 2022. The airport elevation is 281 feet AMSL.

Frazier Lake Airpark

Frazier Lake Airpark is a general aviation airport owned by the Frazier Lake Airpark Corporation. The airport is located approximately 0.15 mile from project alternatives' footprints. The airport operates two parallel runways, a 2,500-foot-long runway (Runway 5-23) and a 3,000-foot-long runway (Runway 5W-23W), and is forecast to increase from an estimated 9,800 operations in 1998 to 23,990 operations by 2020. The airport elevation is 153 feet AMSL.

Los Banos Municipal Airport

Los Banos Municipal Airport is a general aviation airport owned by the City of Los Banos and operated through the Public Works Department. The airport is located approximately 2 miles from the project alternatives' footprints. The airport operates one 3,800-foot-long runway (Runway 14-32) and is forecast to increase from an estimated 16,000 operations in 2010 to 21,000 operations by 2015. The airport elevation is 121 feet AMSL.

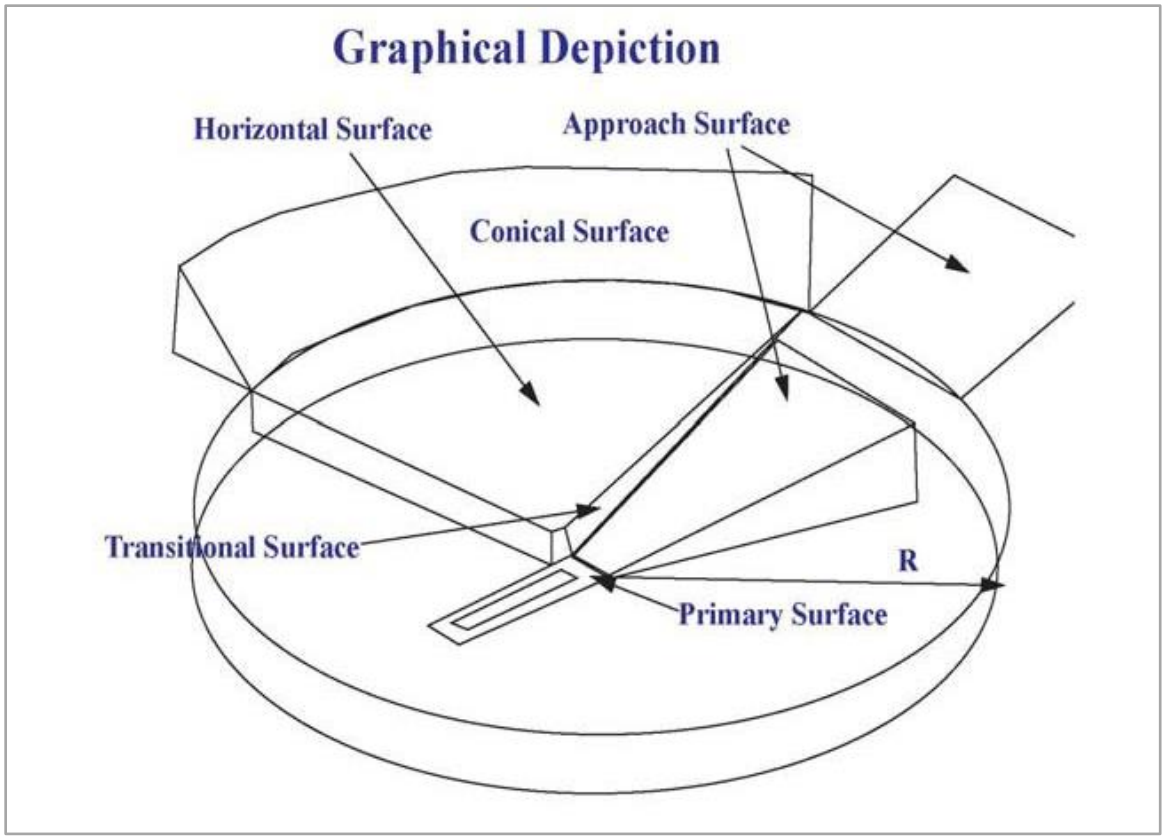
Airport Influence Areas

San Jose (Mineta) International Airport, San Martin (South County) Airport, Los Banos Airport, and Frazier Lake Airpark are subject to airport comprehensive land use plans (CLUP) (County of Santa Clara 2016a, 2016b; County of San Benito 2001; County of Merced 2012). Each CLUP identifies the Airport Influence Area (AIA)—the geographic boundary of the airport land use compatibility plan (ALUCP). Airport master plans and land use compatibility plans from county airport land use commissions regulate land use within airport safety zones to minimize airport hazards and risk of accidents. ALUCPs establish the AIA after a hearing and in consultation with the involved agencies, as required by California Public Utilities Code Section 21675(c). Proposed projects that encroach into an AIA defined in a CLUP are subject to review in accordance with procedures established in the CLUP.

Imaginary Surfaces

Terminal instrument procedures (TERPS) are instrument approach and departure procedures for both civilian and military airports. TERPS define imaginary surfaces to help develop instrument procedures and conduct obstacle analysis for instrument operations. For the purposes of identifying airspace obstacles for airports, the most commonly identified imaginary surfaces include those surfaces for civil aviation facilities defined under 14 C.F.R. Part 77 (Part 77) and TERPS. These imaginary surfaces for civil airports fall into five standard categories: primary, approach, transitional, horizontal, and conical. The size and shape of these surfaces can vary based on the runway category and the type of operating procedures available or planned for that runway. Examples of these surfaces are shown on Figure 1.

Under Part 77 regulations for determining obstructions to airspace, an existing object, including a mobile object, would be an obstruction to air navigation if it penetrates the surface of a takeoff and landing area of an airport or any imaginary surface established for the airport (14 C.F.R. § 77.24).



Source: Washington Department of Transportation Aviation 2012 APRIL 2017

Figure 1 Part 77 Airspace Surfaces

Subpart B, Notice of Construction or Alteration, of the Part 77 regulations requires that the FAA be notified of any proposed construction or alteration of objects within 20,000 feet of a runway and having a height that would exceed a 100:1 imaginary surface (1 foot upward per 100 feet of horizontal distance) beginning at the nearest point of the runway. This requirement applies to runways more than 3,200 feet in length (e.g., Norman Y. Mineta San Jose International Airport). For shorter runways, such as Los Banos Airport Runway 14-32, the notification surface has a 50:1 slope and extends 10,000 feet from the runway. Notification is required with regard to any public-use or military airport. Official determinations of the areas and elevations within which the federal notification requirements apply are subject to the authority of the FAA. The FAA may require filing of notices for proposed construction based on considerations other than the proposed height of the structure. For example, in some areas of complex airspace and high air traffic volumes, the FAA may be concerned about the potential for new construction of any height to interfere with electronic navigation aids. In these areas, FAA may also require notification of proposed construction projects (Caltrans 2011).

Analysis

This analysis evaluates the project alternatives with respect to encroachment into the AIAs for each airport. For purposes of evaluating AIA encroachment, AIA plans for each of the airports were obtained from the latest versions of their respective ALUCPs (County of Santa Clara 2016a, 2016b; County of San Benito 2001; County of Merced 2012). The AIA airspace plans were georeferenced using ArcGIS 9.3 and overlaid with geographic information system (GIS) shape files representing the project alternatives for the purpose of identifying their location relative to each airport's AIA. The online FAR Part 77 Notice Criteria Tool (FAA 2018) was also used to assess FAA notification requirements for proposed construction of the alternatives.

Table 1 shows the project alternatives' encroachment areas in relation to the airports' AIAs. For San Jose Airport, San Martin Airport, Frazier Lake Airpark, and Los Banos Municipal Airport, there were four AIAs included in the airport land use plans; A Request for Qualifications (RFQ) for Frazier Lake Airpark Land Use Compatibility Plan was submitted in August 2018, and will eventually include an updated AIA. Under Alternative 1, 121.3 acres of temporary construction area and 235.4 acres of permanent construction area are within the AIA for airports near the project alternatives. Under Alternative 2, 304.4 acres of temporary construction area and 308.4 acres of permanent construction area are within the AIA for airports near the project alternatives. Under Alternative 3, 170.1 acres of temporary construction area and 256.6 acres of permanent construction area are within the AIA for airports near the project alternatives. Under Alternative 4, 100.2 acres of temporary construction area and 213.9 acres of permanent construction area are within the AIA for airports near the project alternatives.

Table 1 Airport Influence Area Encroachment Area for Each Project Alternative

Airport	Encroachment Area (acres)							
	Alternative 1		Alternative 2		Alternative 3		Alternative 4	
	Temp.	Perm.	Temp.	Perm.	Temp.	Perm.	Temp.	Perm.
Mineta/San Jose International Airport	55.0	97.9	96.5	86.4	96.5	86.4	15.2	70.5
San Martin Airport	24.3	38.7	165.9	123.1	50.2	49.6	36.1	44.9
Frazier Lake Airpark	42.0	98.8	42.0	98.8	23.4	120.6	42.0	98.8
Los Banos Municipal Airport	0	0	0	0	0	0	0	0
Total	121.3	235.4	304.4	308.4	170.1	256.6	93.4	214.4

Perm. = permanent

Signaling and train control elements within the right-of-way would include 10-foot-by-8-foot communications shelters or signal huts/bungalows that house signal relay components and microprocessor components, cabling to the field hardware and track, signals, and switch machines on the track. Communications towers within these facilities would be located near track switches and would be grouped with other traction power, maintenance, station, and similar HSR facilities where possible. Where communications towers cannot be located with traction power substations or other HSR facilities, the communications facilities would be located near the HSR corridor in a fenced area of approximately 20 feet by 15 feet. The communications towers for each project alternative are identified in Tables 2a–d.

Results

Norman Y. Mineta San Jose International Airport

All four project alternatives encroach into the AIA of San Jose International Airport (SJC), as shown in Table 1.

All four project alternatives have communication towers located in Santa Clara (Radio Towers 1 and 2) and San Jose (Radio Towers 3 through 9). According to the FAR Part 77 Notice Criteria Tool, in Santa Clara, Radio Tower 1 would exceed height restrictions by 53 feet, and Radio Tower 2, by 61 feet. Both of the towers are in proximity to a navigation facility associated with the airport, and may affect the assurance of navigation signal reception, according to the FAR Part 77 Notice Criteria Tool. The nearest runway to the proposed communication towers is SJC Runway 12L/30R. The FAR Part 77 Notice Criteria Tool also indicates that the proposed communication towers would exceed an instrument approach area by 67, 70, 70, 96,103, and 103 feet for Radio Towers 3, 4, 5, 6, 7, and 8, respectively, and an aeronautical study for each tower would need to be conducted to determine if the structure would exceed a standard of subpart C of 14 C.F.R. Part 77. Radio Tower 9 is in close proximity to a navigation facility associated with the airport, and may affect the assurance of navigation signal reception. The FAR Part 77 Notice Criteria Tool

indicates that FAR Part 77 notification would be required for approval of construction of the communication towers in Santa Clara and San Jose under all four alternatives.

San Martin Airport

All four project alternatives encroach into the AIA of San Martin Airport (E16), as shown in Table 1.

All four project alternatives have communication towers located in San Martin (Radio Towers 29 through 33). According to the FAR Part 77 Notice Criteria Tool, the proposed communication towers would exceed an instrument approach area by 24, 43, 43, 41, and 44 feet for Radio Towers 29, 30, 31, 32, and 33 respectively. An aeronautical study for each tower would need to be conducted to evaluate the proposal because the OEAAA source is not able to provide airport or runway data for San Martin Airport. The nearest runway to the proposed communication tower locations is E16 Runway 14/32. The FAR Part 77 Notice Criteria Tool indicates that FAR Part 77 notification would be required for approval of construction of the communication towers in San Martin under all four project alternatives.

Frazier Lake Airpark

Each of the four project alternatives encroaches into the AIA of Frazier Lake Airpark.

The FAR Part 77 Notice Criteria Tool indicates that FAR Part 77 notification would not be required for approval of construction of the communication towers in San Benito and Santa Clara Counties in the vicinity of Frazier Lake Airpark under all four project alternatives.

Los Banos Municipal Airport

None of the four project alternatives encroach into the AIA of Los Banos Municipal Airport.

The FAR Part 77 Notice Criteria Tool indicates that FAR Part 77 notification would not be required for approval of construction of the communication towers in Merced County in the vicinity of Los Banos Municipal Airport under all four project alternatives.

Heliports

Three privately-operated heliports in Santa Clara County are located within 2 miles of the project alternatives' footprints. These are located at the Santa Clara Towers building in San Jose, Santa Clara Valley Medical Center in San Jose, and St. Louise Hospital in Gilroy. The three heliports are rooftop facilities associated with medical center and residential high-rise properties and would not be affected by project construction and operations.

Privately-Operated Airstrips

No privately-operated airstrips were identified within 2 miles of the project alternatives' footprints for any of the project alternatives.

APPENDIX 3.12-A: RELOCATION ASSISTANCE DOCUMENTS

CALIFORNIA High-Speed Rail Authority

Your Rights and Benefits as a Displacee Under the Uniform Relocation Assistance Program ***(Residential)***

July 2013

www.hsr.ca.gov

INTRODUCTION

In building any large, modern transportation project, the displacement of a small percentage of the population is often necessary. However, it is the policy of the California High-Speed Rail Authority (Authority) that displaced persons shall not suffer unnecessarily as a result of a program, like the High-Speed Rail Project (Project) that is designed to benefit the public as a whole.

Individuals, families, businesses, farms, and nonprofit organizations displaced by the Project may be eligible for relocation advisory services and payments.

This brochure provides information about available relocation services and payments. If you are required to move as the result of the Project, a Relocation Agent will contact you. The Relocation Agent will be able to answer your specific questions and provide additional information.

UNIFORM RELOCATION ASSISTANCE AND REAL PROPERTY ACQUISITION POLICIES ACT OF 1970 AS AMENDED "THE UNIFORM ACT"

The purpose of the Uniform Act is to provide for uniform and equitable treatment of persons displaced from their homes, businesses, farms, or nonprofit organizations by federal and federally assisted programs and to establish uniform and equitable land acquisition policies for federal and federally assisted programs.

Title 49, Part 24, of the Code of Federal Regulations implements the Uniform Act in accordance with the following relocation assistance objective:

> To ensure that persons displaced as a direct result of federal or federally-assisted projects are treated fairly, consistently and equitably so that such persons will not suffer disproportionate injuries as a result of projects designed for the benefit of the public as a whole.

While every effort has been made to assure the accuracy of this booklet, you must understand that it does not have the force and effect of law, rule, or regulation governing the payment of benefits. In the event of any difference between a statement in this brochure and any provision of law, rule or regulation, the latter will be followed.

SOME IMPORTANT DEFINITIONS

You will be able to understand your relocation benefits better if you become familiar with the following terms:

Comparable Replacement Dwelling is a dwelling which is:

1. Decent, safe, and sanitary. (*See definition below*.)
2. Functionally equivalent to the displacement dwelling.
3. Adequate in size to accommodate the persons being relocated.
4. In an area not subject to unreasonable adverse environmental conditions.
5. In a location generally not less desirable than the location of your displacement dwelling with respect to public utilities and commercial and public facilities, and reasonably accessible to your place of employment.
6. On land that is typical in size for residential development with typical improvements.
7. Currently available on the market.
8. Within your financial means.

Decent, Safe and Sanitary (DS&S) Dwelling is a dwelling that meets applicable local housing and occupancy codes. It also shall:

1. Be structurally sound, weather tight, and in good repair.

2. Contain a safe electrical wiring system adequate for lighting and other devices.

3. Contain a heating system capable of sustaining a healthful temperature (of approximately 70 degrees) for a displaced person, except in those areas where local climatic conditions do not require such a system.

4. Be adequate in size with respect to the number of rooms and area of living space needed to accommodate the displaced persons. The number of persons occupying each habitable room used for sleeping purposes shall not exceed that permitted by local housing codes.

5. Have a separate, well-lighted and ventilated bathroom that provides privacy to the user and contains a sink, bathtub or shower stall, and a toilet, all in good working order and properly connected to appropriate sources of water and to a sewage drainage system.

   Note: *In the case of a housekeeping dwelling, there shall be a kitchen area that contains a fully usable sink, properly connected to potable hot and cold water and to a sewage drainage system, and adequate space and utility service connections for a stove and refrigerator.*

6. Contains unobstructed egress to safe, open space at ground level. If the replacement dwelling unit is on the second story or above, with access directly from or through a common corridor, the common corridor must have at least two means of egress.

7. For a displaced person with a disability, be free of any barriers which would preclude reasonable ingress, egress, or use of the dwelling by that displaced person.

Displaced Person or Displacee is any person who moves from real property or moves personal property from real property as a result of the acquisition of the real property, in whole or in part, or as the result of a written notice from the agency of its intent to acquire the real property needed for this transportation project. In the case of a partial acquisition, the Authority shall determine if a person is displaced as a direct result of the acquisition.

Persons **not lawfully present** in the United States are not eligible to receive relocation payments and assistance.

Relocation benefits will vary, depending upon the type and length of occupancy. As a residential displacee, you will be classified as either:

- An owner occupant of a residential property (includes mobile homes)

- A tenant occupant of a residential property (includes mobile homes and sleeping rooms)

Dwelling is the place of permanent or customary and usual residence of a person, according to local custom or law, including a single family house; a single family unit in a two-family, multi-family, or multi-purpose property; a unit of a condominium or cooperative housing project; a non-housekeeping unit; a mobile home; or any other residential unit.

Owner is a person who is considered to have met the requirement to own a dwelling if the person purchases or holds any of the following interests in real property:

1. Fee title, a life estate, a land contract, a 99-year lease, or a lease, including any options for extension, with at least 50 years to run from the date of acquisition; **OR**

2. An interest in a cooperative housing project that includes the right to occupy a dwelling; **OR**

3. A contract to purchase any interests or estates described in (1) or (2); **OR**

4. Any other interest, including a partial interest, which in the judgment of the Authority warrants consideration as ownership.

Tenant is a person who has the temporary use and occupancy of real property owned by another.

MOVING EXPENSES

If you qualify as a displaced person, you are entitled to reimbursement of your moving costs and certain related expenses incurred in moving. The methods of moving and the various types of moving cost payments are explained below.

Displaced individuals and families may choose to be paid on the basis of actual, reasonable moving costs and related expenses, or according to a fixed moving cost schedule. However, to ensure your eligibility and prompt payment of moving expenses, you should contact your Relocation Agent before you move.

You Can Choose Either

Actual Reasonable Moving Costs
You may be paid for your actual reasonable moving costs and related expenses when a commercial mover performs the move. Reimbursement will be limited to a move of 50 miles or less. Related expenses ***may*** include:

- Transportation
- Packing and unpacking personal property
- Disconnecting and reconnecting household appliances
- Temporary storage of personal property
- Insurance while property is in storage or transit

OR

Fixed Moving Cost Schedule
You may be paid on the basis of a fixed moving cost schedule. Under this option, you will not be eligible for reimbursement of related expenses listed above. The fixed schedule is designed to cover these expenses.

Examples (Year 2012 Rate):
4 Rooms - $1,295
7 Rooms - $2,090

The Fixed Move Schedule for a furnished unit (e.g. you are a tenant of an apartment that is furnished by your landlord) is also based on the following schedule.

Example (Year 2012 Rate):
1 Room - $450
Each additional room - $85

Under the Fixed Move Schedule, you will not receive any additional payments for temporary storage, lodging, transportation or utility hook-ups.

REPLACEMENT HOUSING PAYMENTS

The type of Replacement Housing Payment (RHP) depends on whether you are an owner or a tenant, and on the length of your occupancy in the property being acquired. If you are a qualified **owner occupant** of more than 180 days prior to the initiation of negotiations for the acquisition of your property, you may be entitled to a RHP that consists of:

Price Differential, AND
Mortgage Differential, AND
Incidental Expenses;

OR

Rent Differential

If you are a qualified **owner occupant** of more than 90 days but less than 180 days, **OR** you are a qualified **tenant occupant** of at least 90 days, you may be entitled to a RHP as follows:

Rent Differential

OR

Downpayment Option

Length of occupancy simply means counting the number of days that you actually occupied a dwelling before the date of initiation of negotiations by the Authority for the purchase of the property. The term "initiation of negotiations" means the date the Authority makes the first personal contact with the owner of real property, or the owner's representative, to give either of them a written offer for the property to be acquired.

Note: *If you have been in occupancy* ***less than 90 days*** *before the initiation of negotiations and the property is subsequently acquired, or if you move onto the property after the initiation of negotiations and you are still in occupancy on the date of acquisition, you may or may not be eligible for a Replacement Housing Payment. Check with your Relocation Agent before you make any decision to vacate your property.*

FOR OWNER OCCUPANTS OF 180 DAYS OR MORE

If you qualify as a 180-day owner occupant, you may be eligible, in addition to the fair market value of your property, for a Replacement Housing Payment that consists of a Price Differential, Mortgage Differential and/or Incidental Expenses.

The **Price Differential** payment is the amount by which the cost of a replacement dwelling exceeds the acquisition cost of the displacement dwelling. This payment will assist you in purchasing a comparable decent, safe, and sanitary (DS&S) replacement dwelling. The Authority will compute the maximum payment you may be eligible to receive.

In order to receive the full amount of the calculated Price Differential, you must purchase a decent, safe and sanitary dwelling and spend at least the amount calculated by the Authority to be the cost of a comparable replacement property. (spend to get requirement)

The **Mortgage Differential** payment will reimburse you for any increased mortgage interest costs you might incur because the interest rate on your new mortgage exceeds the interest rate on the property acquired by the Authority. The payment computation is complex as it is based on prevailing rates, your existing loan and your new loan. Also, a part of this payment may be prorated, for example, as reimbursement for a portion of your loan origination fees and mortgage points.

To be eligible to receive this payment, the acquired property must have been encumbered by a bona fide mortgage that was a valid lien for at least 180 days prior to the initiation of negotiations.

You may also be reimbursed for any actual and necessary **Incidental Expenses** that you incur in relation to the purchase of your replacement property. These expenses may be those costs for title search, recording fees, credit report, appraisal report, and certain other closing costs associated with the purchase of property. You will not be reimbursed for any recurring costs such as prepaid real estate taxes and property insurance.

If the total amount of your **Replacement Housing Payment** (Price Differential, Mortgage Differential and Incidental Expenses) exceeds $22,500, the payment must be deposited directly into an escrow account or paid directly to the mortgage company.

Examples of Price Differential Payment Computation:
Assume that the Authority purchases your property for $98,000. After a thorough study of available, decent, safe and sanitary dwellings on the open market, the Authority determines that a comparable replacement property will cost you $100,000. If your purchase price is $100,000, you will receive $2,000 (*see Example A*).

If your actual purchase price is more than $100,000, you pay the difference *(see Example B*). If your purchase price is less than $100,000, the differential payment will be based on actual costs (*see Example C*).

How much of a differential payment you receive depends on how much you actually spend on a replacement dwelling as shown in these examples:

The Authority's Computation

Cost of Comparable Replacement Property	$100,000
Acquisition Price of Your Property	-$ 98,000
Maximum Price Differential	$ 2,000

Example A

Purchase Price of Replacement Property	$100,000
Cost of Comparable Replacement Property	$100,000
Acquisition Price of Your Property	-$ 98,000
Maximum Price Differential	$ 2,000

Example B

Purchase Price of Replacement Property	$105,000
Cost of Comparable Replacement Property	$100,000
Acquisition Price of Your Property	- $ 98,000
Maximum Price Differential	$ 2,000
You Must Pay the Additional	$ 5,000

Example C

Cost of Comparable Replacement Property	$100,000
Purchase Price of Replacement Property	$ 99,000
Acquisition Price of Your Property	- $ 98,000
Price Differential	$ 1,000

In Example C you will only receive $1,000, not the full amount of the Authority's "Comparable Replacement Property," because of the "Spend to Get" requirements.

If you are a "180-day owner occupant" in order to receive the full amount of the Replacement Housing Payment *(Price Differential, Mortgage Differential and Incidental Expenses),* **you must:**

A) Purchase and occupy a DS&S replacement dwelling within one year after the later of:

1. The date you first receive a notification of an available replacement house, **OR**

2. The date that the Authority has paid the acquisition cost of your current dwelling (usually the closing of escrow on State's acquisition),

AND

B) Spend at least the amount of the Authority's "Comparable Replacement Property" for a replacement property,

AND

C) File a claim for relocation payments within 18 months of the later:

1. The date you vacate the property acquired by the Authority, **OR**

2. The date that the Authority has paid the acquisition cost of your current dwelling (usually the close of escrow on State's acquisition)

You will not be eligible to receive any relocation payments until the Authority has actually made the first written offer to purchase the property. Also, you will receive at least 90 days' written notice before you must move.

FOR OWNER OCCUPANTS AND TENANTS OF 90 DAYS OR MORE

If you qualify as a 90-day occupant (either as an owner or tenant), you may be eligible for a Replacement Housing Payment in the form of a Rent Differential.

The **Rent Differential** payment is designed to assist you in renting a comparable decent, safe and sanitary replacement dwelling. The payment is based on the difference between the base monthly rent for the property acquired by the Authority (including average monthly cost for utilities) and the lesser of:

a. The monthly rent and estimated average monthly cost of utilities for a comparable replacement dwelling as determined by the Authority, **OR**

b. The monthly rent and estimated average monthly cost of utilities for the decent, safe and sanitary dwelling that you actually rent as a replacement dwelling.

Utility costs are those expenses you incur for heat, lights, water and sewer regardless of the source (e.g. electricity, propane, and septic system). They do not include garbage, cable, telephone, or security. The utilities at your property are the average costs over the last 12 months. The cost of utilities at the comparable replacement property is based on the estimated costs for the last 12 months for the type of dwelling and area used in the calculation.

This difference between (a) and (b) is multiplied by 42 months and may be paid to you in a lump sum payment or in periodic installments in accordance with policy and regulations.

In order to receive the full amount of the calculated Rent Differential, you must rent a decent, safe and sanitary dwelling and spend at least the amount calculated by the Authority to be the rental rate of a comparable replacement property.

This payment may, with certain limitations, be converted to a **Downpayment Option** to assist you in purchasing a replacement property.

Example of Rent Differential Payment Computation:
After a thorough study of comparable, decent, safe and sanitary dwellings that are available for rent, the Authority determines that a comparable replacement property will rent for $325.00 per month.

The Authority's Computation (rates are per month)

Rental Rate for Comparable Replacement Property	$ 325
PLUS average estimated utilities costs	+100
TOTAL Cost to Rent Comparable Replacement Property	= $ 425
Rental Rate for Your Current Property	$ 300
PLUS average utilities costs	+ 90
TOTAL Cost to Rent Current Property	= $ 390
Comparable Replacement Property including utilities	$ 425
Cost you currently pay to rent your property including utilities	- 390
Difference	= $ 35

Multiplied by 42 months = $1,470 Rent Differential

Example A:

Rental Rate you pay for a Replacement Property including estimated average utilities costs	$ 525
Comparable Replacement Property including utilities	$ 425
Cost you currently pay to rent your property including utilities	$ 390

Because $425 is less than $525, the Rent Differential is based on the difference between $390 and $425.

Rent Differential ($35 x 42 months = $1,470)

In this case you spent "at least" the amount of the Comparable Replacement Property on the replacement property and will receive the full amount.

Example B:

Rental Rate you pay for a Replacement Property including estimated average utilities costs	$ 400
Comparable Replacement Property including utilities	$ 425
Cost you currently pay to rent your property including utilities	$ 390

Because $400 is less than $425, the Rent Differential is based on the difference between $400 and $390.

Rent Differential ($10 x 42 months = $420)

In this case you spent "less than" the amount of the Comparable Replacement Property on the replacement property and will not receive the full amount.

If you are a "90- day owner occupant" in order to receive the full amount of your replacement housing payment *(Rent Differential)***, you must:**

A) Rent and occupy a DS&S replacement dwelling within one year after the later of:

1. The date you first receive a notification of an available replacement dwelling, **OR**

2. The day you vacate the property acquired by the Authority, **AND**

B) Spend at least the amount of the Authority's calculation of "Comparable Replacement Property" to rent a replacement property,

AND

C) File a claim for relocation payments within 18 months of the later of:

1. The date you vacate the property acquired by the Authority, **OR**

2. The date that the Authority has paid the acquisition cost of your current dwelling (usually the close of escrow on State's acquisition)

You will not be eligible to receive any relocation payments until the Authority has actually made the first written offer to purchase the property. Also, you will receive at least 90 days' written notice before you must move.

Note 1: *The time periods for a 90-day owner occupant are different from those for a 180-day owner occupant.*

Note 2: *If the Rent Differential is converted to a Downpayment Option, there is no "spend-to-get" requirement.*

DOWNPAYMENT OPTION

The Rent Differential payment may, with certain limitations, be converted to a **Downpayment Option** to assist you in purchasing a replacement property. The downpayment option is a direct conversion of the Rent Differential payment.

If the Authority's calculated Rent Differential is between $0 and $5,250, your downpayment option will be $5,250, which can be used toward the purchase of a replacement decent, safe and sanitary dwelling.

If the Rent Differential is over $5,250, you may be able to convert the entire amount of the Rent Differential to a downpayment option.

The downpayment option must be used for the acquisition of the replacement dwelling, plus any eligible incidental expenses (see "180-day Owner Occupants Incidental Expenses") related to the purchase of the property. You must work closely with your Relocation Agent to ensure you can utilize the full amount of your downpayment option toward the purchase.

If any portion of the Rent Differential was used prior to the decision to convert to a downpayment option, those advance payments will be deducted from the entire benefit.

LAST RESORT HOUSING

On most projects, an adequate supply of housing will be available for sale and for rent, and the benefits provided will be sufficient to enable you to relocate to comparable housing. However, there may be projects in certain locations where the supply of available housing is insufficient to provide the necessary housing for those persons being displaced. In such cases, the Authority will utilize a method called Last Resort Housing. Last Resort Housing allows the Authority to construct, rehabilitate or modify housing in order to meet the needs of the people displaced from a project. The Authority can also pay above the statutory limits of $5,250 and $22,500 in order to make available housing affordable.

RELOCATION ADVISORY ASSISTANCE

Any individual, family, business or farm displaced by the Authority shall be offered relocation advisory assistance for the purpose of locating a replacement property. Relocation services are provided by qualified personnel employed by, or under contract with, the Authority. It is their goal and desire to be of service to you and to assist in any way possible to help you relocate successfully. A Relocation Agent from the Authority will contact you personally. Relocation services and payments will be explained to you in accordance with your eligibility. During the Agent's initial interview with you, your housing needs and desires will be determined as well as your need for assistance. You cannot be required to move unless at least one comparable replacement dwelling is made available to you. You can expect to receive the following services, advice and assistance from your Relocation Agent who will:

- Explain the relocation benefits and eligibility requirements.
- Provide the amount of the replacement housing payments in writing.
- Assure the availability of a comparable replacement property before you move.
- Inspect possible replacement residential units for DS&S compliance.
- Provide information on counseling you can obtain to help minimize hardships in adjusting to your new location.
- Assist you in completing loan documents, rental applications or Relocation Claims Forms.

AND provide information on:

- Security deposits
- Interest rates and terms
- Typical downpayments
- VA and FHA loan requirements
- Real property taxes
- Consumer education literature on housing

If you desire, your Relocation Agent will give you current listings of other available replacement housing. Transportation will be provided to inspect available housing, especially if you are elderly or handicapped. Though you may use the services of a real estate broker, the Authority cannot provide a referral.

Your Relocation Agent is familiar with the services provided by others in your community and will provide information on other federal, state, and local housing programs offering assistance to displaced persons. If you have special needs, your Relocation Agent will make every effort to secure the services of those agencies with trained personnel who have the expertise to help you.

If the high-speed rail project will require a considerable number of people to be relocated, the Authority may establish a temporary Relocation Field Office on or near the project. Project relocation offices will be open during convenient hours and evening hours if necessary.

In addition to these services, the Authority is required to coordinate its relocation activities with other agencies causing displacements to ensure that all persons displaced receive fair and consistent relocation benefits.

Remember: YOUR RELOCATION AGENT is there to offer advice and assistance. Do not hesitate to ask questions. And be sure you fully understand all of your rights and available benefits.

YOUR RIGHTS AS A DISPLACEE

All eligible displacees have a freedom of choice in the selection of replacement housing, and the Authority will not require any displaced person to accept a replacement dwelling provided by the Authority. If you decide not to accept the replacement housing offered by the Authority, you may secure a replacement dwelling of your choice, providing it meets DS&S housing standards. The Authority will not pay more than your calculated benefits on any replacement property.

The most important thing to remember is that the replacement dwelling you select must meet the basic “decent, safe, and sanitary” standards. **DO NOT** execute a purchase agreement or a rental agreement

until a representative from the Authority has inspected and certified in writing that the dwelling you propose to occupy meets the basic standards. **DO NOT** jeopardize your right to receive a replacement housing payment by moving into a substandard dwelling.

It is important to remember that your relocation benefits will not have an adverse effect on your:

- Social Security Eligibility
- Welfare Eligibility
- Income Taxes

In addition, Title VIII of the Civil Rights Act of 1968 and later acts and amendments make discriminatory practices in the purchase and rental of most residential units illegal if based on race, color, religion, sex, or national origin.

Whenever possible, minority persons shall be given reasonable opportunities to relocate to a decent, safe, and sanitary replacement dwelling, not located in an area of minority concentration, and that is within their financial means. This policy, however, does not require the Authority to provide a person a larger payment than is necessary to enable that person to relocate to a comparable replacement dwelling.

The Authority's Non-Discrimination Policy ensures that all services and/or benefits will be administered to the general public without regard to race, color, national origin, or sex in compliance with Title VI of the 1964 Civil Rights Act (42 USC, sec. 2000d, et seq.). And you always have the right to appeal any decision by the Authority regarding your relocation benefits and eligibility.

Your right of appeal is guaranteed in the Uniform Act which states that any person may file an appeal with the head of the responsible agency if that person believes that the agency has failed to determine properly the person's eligibility or the amount of a payment authorized by the Act.

If you indicate your dissatisfaction, either verbally or in writing, the Authority will assist you in filing an appeal and will explain the procedures to be followed. You will be given a prompt and full opportunity to be heard. You have the right to be represented by legal counsel or other representative in connection with the appeal (but solely at your own expense). The Authority will consider all pertinent justifications and materials submitted by you and other available information needed to ensure a fair review. The Authority will provide you with a written determination resulting from the appeal with an explanation of the basis for the decision. If you are still dissatisfied with the relief granted, the Authority will advise you that you may seek judicial review.

CALIFORNIA High-Speed Rail Authority

Your Rights and Benefits as a Displacee Under the Uniform Relocation Assistance Program ***(Mobile Home)***

July 2013

www.hsr.ca.gov

INTRODUCTION

In building any large, modern transportation project, the displacement of a small percentage of the population is often necessary. However, it is the policy of the California High-Speed Rail Authority (Authority) that displaced persons shall not suffer unnecessarily as a result of a program, like the High-Speed Rail Project (Project), designed to benefit the public as a whole.

Individuals, families, businesses, farms, and nonprofit organizations displaced by the Project may be eligible for relocation advisory services and payments.

This brochure provides information about available relocation services and payments. If you are required to move as the result of the Project, a Relocation Agent will contact you. The Relocation Agent will be able to answer your specific questions and provide additional information.

UNIFORM RELOCATION ASSISTANCE AND REAL PROPERTY ACQUISITION POLICIES ACT OF 1970 AS AMENDED "THE UNIFORM ACT"

The purpose of the Uniform Act is to provide for uniform and equitable treatment of persons displaced from their homes, businesses, farms, or nonprofit organizations by federal and federally assisted programs and to establish uniform and equitable land acquisition policies for federal and federally assisted programs.

Title 49, Part 24, of the Code of Federal Regulations implements the Uniform Act in accordance with the following relocation assistance objective:

> To ensure that persons displaced as a direct result of federal or federally-assisted projects are treated fairly, consistently and equitably so that such persons will not suffer disproportionate injuries as a result of projects designed for the benefit of the public as a whole.

While every effort has been made to assure the accuracy of this booklet, you must understand that it does not have the force and effect of law, rule, or regulation governing the payment of benefits. In the event of any difference between a statement in this brochure and any provision of law, rule or regulation, the latter will be followed.

SOME IMPORTANT DEFINITIONS

You will be able to understand your relocation benefits better if you become familiar with the following terms:

Comparable Replacement Dwelling is a dwelling which is:

1. Decent, safe, and sanitary. (*See definition below*.)
2. Functionally equivalent to the displacement dwelling.
3. Adequate in size to accommodate the persons being relocated.
4. In an area not subject to unreasonable adverse environmental conditions.
5. In a location generally not less desirable than the location of your displacement dwelling with respect to public utilities and commercial and public facilities, and reasonably accessible to your place of employment.
6. On land that is typical in size for residential development with typical improvements.
7. Currently available on the market.
8. Within your financial means.

Decent, Safe and Sanitary (DS&S) Dwelling is a dwelling that meets applicable local housing and occupancy codes. It also shall:

1. Be structurally sound, weather tight, and in good repair.

2. Contain a safe electrical wiring system adequate for lighting and other devices.

3. Contain a heating system capable of sustaining a healthful temperature (of approximately 70 degrees) for a displaced person, except in those areas where local climatic conditions do not require such a system.

4. Be adequate in size with respect to the number of rooms and area of living space needed to accommodate the displaced persons. The number of persons occupying each habitable room used for sleeping purposes shall not exceed that permitted by local housing codes.

5. Have a separate, well-lighted and ventilated bathroom that provides privacy to the user and contains a sink, bathtub or shower stall, and a toilet, all in good working order and properly connected to appropriate sources of water and to a sewage drainage system.

   Note: *In the case of a housekeeping dwelling, there shall be a kitchen area that contains a fully usable sink, properly connected to potable hot and cold water and to a sewage drainage system, and adequate space and utility service connections for a stove and refrigerator.*

6. Contains unobstructed egress to safe, open space at ground level. If the replacement dwelling unit is on the second story or above, with access directly from or through a common corridor, the common corridor must have at least two means of egress.

7. For a displaced person with a disability, be free of any barriers which would preclude reasonable ingress, egress, or use of the dwelling by that displaced person.

Displaced Person or Displacee is any person who moves from real property or moves personal property from real property as a result of the acquisition of the real property, in whole or in part, or as the result of a written notice from the agency of its intent to acquire the real property needed for this transportation project. In the case of a partial acquisition, the Authority shall determine if a person is displaced as a direct result of the acquisition.

Residents **not lawfully present** in the United States are not eligible to receive relocation payments and assistance.

Relocation benefits will vary, depending upon the type and length of occupancy. As a residential displacee, you will be classified as either:

- An owner occupant of a residential property (includes mobile homes)

- A tenant occupant of a residential property (includes mobile homes and sleeping rooms)

Dwelling is the place of permanent or customary and usual residence of a person, according to local custom or law, including a single family house; a single family unit in a two-family, multi-family, or multi-purpose property; a unit of a condominium or cooperative housing project; a non-housekeeping unit; a mobile home; or any other residential unit.

Mobile Home generally refers to single, double or triple wide mobile home units. It does not include manufactured homes that are permanently affixed to the realty, as these are treated as single family dwellings. However, it may include certain trailers or recreational vehicles that are a primary residence depending on how they are permanently affixed to the real property.

Owner is a person who is considered to have met the requirement to own a dwelling if the person purchases or holds any of the following interests in real property:

1. Fee title, a life estate, a land contract, a 99-year lease, or a lease, including any options for extension, with at least 50 years to run from the date of acquisition; **OR**

2. An interest in a cooperative housing project that includes the right to occupy a dwelling; **OR**

3. A contract to purchase any interests or estates described in (1) or (2); **OR**

4. Any other interest, including a partial interest, which in the judgment of the Authority warrants consideration as ownership.

Tenant is a person who has the temporary use and occupancy of real property owned by another.

MOBILE HOMES

If the mobile home ***is not*** acquired by the Authority, the owner (regardless of who occupies it) of a mobile home is eligible for a payment to move the mobile home to a replacement piece of land based on an actual cost basis. This includes the cost to disassemble, move and reassemble any porches, decks, skirting and/or awnings.

Additional costs may be eligible for reimbursement if the Authority determines they are “actual, reasonable and necessary.” Some of these costs might include:

- Anchoring the unit to the new pad
- Additional axles or brakes on the mobile home that are required for transportation
- Temporary protection of an extra wide mobile home unit that must be split during the move
- Utility hook-ups to the unit (e.g. water, sewer, septic, electricity, gas), if utilities are already available to the mobile home location (e.g. pad)
- Necessary repairs to meet local and state codes
- Modifications necessary to meet “decent, safe and sanitary” requirements
- With limitations, a non-returnable entrance fee to the mobile home park

The movement of the mobile home must be performed by a qualified mover and the payment will be based on the lower of two bids obtained by the owner of the mobile home and approved by the Authority. The Authority cannot pay for the move of the mobile home beyond 50 miles unless there are no suitable replacement pieces of land or mobile home parks within the 50-mile radius. Approval for a move beyond 50 miles must be obtained in advance of the move.

MOVING EXPENSES

In addition to moving the mobile home, the occupants (regardless of who owns it) may be eligible for a payment to move their personal property, if they qualify as “displaced persons.”

The methods of moving and the various types of moving cost payments are explained below. Displaced individuals and families may choose to be paid on the basis of actual, reasonable moving costs and related expenses, or according to a fixed moving cost schedule. However, to ensure your eligibility and prompt payment of moving expenses, you should contact your Relocation Agent before you move.

You Can Choose Either

Actual Reasonable Moving Costs. You may be paid for your actual reasonable moving costs and related expenses when a commercial mover performs the move.

Reimbursement will be limited to a move of 50 miles or less. Related expenses ***may*** include:

- Transportation
- Packing and unpacking personal property
- Disconnecting and reconnecting household appliances
- Temporary storage of personal property
- Insurance while property is in storage or transit

OR

Fixed Moving Cost Schedule
You may be paid on the basis of a fixed moving cost schedule. Under this option, you will not be eligible for reimbursement of related expenses listed above. The fixed schedule is designed to cover these expenses.

Examples (Year 2012 Rate):
4 Rooms - $1,295
7 Rooms - $2,090

If the furniture is moved with the mobile home, the amount of the fixed payment is based on the following schedule:

Example (Year 2012 Rate):
1 Room - $450
Each additional room - $85

Normally no additional payments for temporary storage, lodging, transportation or utility hook-ups of household appliances can be paid with the fixed move schedule. However, the mobile home occupants who choose to move back into the same mobile home at the new location may receive an allowance for food and lodging during the move and set-up time. Also, utility hook-ups to the mobile home unit may be eligible for reimbursement.

Note: *Even if the mobile home is acquired by the Authority, the occupants of the mobile home (regardless of who owns it) are still eligible for a payment to move their personal property.*

REPLACEMENT HOUSING PAYMENTS

The occupant of a mobile home unit may be eligible for a replacement housing payment. The type of Replacement Housing Payment (RHP) depends on whether you are an owner or a tenant *of the mobile home,* and the length of occupancy in the mobile home unit that is on property being acquired for the Project.

If you are a qualified **owner occupant** of both the land and the mobile home for more than 180 days prior to the initiation of negotiations for the acquisition of your property, and the mobile home unit is acquired by the Authority, you may be entitled to a RHP that consists of:

Price Differential, AND
Mortgage Differential, AND
Incidental Expenses;

OR

Rent Differential

You do not have to purchase and occupy another mobile home unit in order to receive your RHP - however, the new residential unit must meet the “decent, safe and sanitary” requirements.

If the mobile home is not acquired by the Authority, you may still be eligible for a RHP to assist you with purchasing a replacement piece of land where you can move your mobile home.

It is important to know that if you ***do not own both*** the mobile home and the property, your RHP can be limited. You must work closely with your Relocation Agent to fully understand your eligibility.

If you are a qualified **owner occupant** of the mobile home for more than 90 days but less than 180 days, OR you are a qualified **tenant occupant** of the mobile home for at least 90 days, you may be entitled to a RHP as follows:

Rent Differential

OR

Downpayment Option

As the occupant of a mobile home, regardless of the length of time or your status as an owner or tenant, your payment will vary depending upon the following:

- Whether the mobile home unit was acquired by the Authority
- Whether you are the owner of the mobile home
- Whether you will occupy the mobile home at the new location if it is moved
- Whether you choose to occupy another type of unit such as a single family residence.

Length of occupancy simply means counting the number of days that you actually occupied the mobile home unit on the land that is being acquired by the Authority prior to the date of initiation of negotiations by the Authority for the purchase of the property. The term “initiation of negotiations” means the date the Authority makes the first personal contact with the owner of the real property, or the owner’s representative, to give either of them a written offer for the property to be acquired.

Note: *If you have been in occupancy* ***less than 90 days*** *before the initiation of negotiations and the property is subsequently acquired, or if you move onto the property after the initiation of negotiations and you are still in occupancy on the date of acquisition, you may or may not be eligible for a Replacement Housing Payment. Check with your Relocation Agent before you make any decision to vacate your property.*

FOR OWNER OCCUPANTS OF 180 DAYS OR MORE

If you qualify as a 180-day owner occupant, you may be eligible, in addition to the fair market value of your property, for a Replacement Housing Payment that consists of a Price Differential, Mortgage Differential and/or Incidental Expenses.

The **Price Differential** payment is the amount by which the cost of a replacement dwelling exceeds the acquisition cost of the displacement dwelling. This payment will assist you in purchasing a comparable decent, safe, and sanitary (DS&S) replacement dwelling. The Authority will compute the maximum payment you may be eligible to receive.

In order to receive the full amount of the calculated Price Differential, you must purchase a decent, safe and sanitary dwelling and spend at least the amount calculated by the Authority to be the cost of a comparable replacement property.

The **Mortgage Differential** payment will reimburse you for any increased mortgage interest costs you might incur because the interest rate on your new mortgage exceeds the interest rate on the property acquired by the Authority. The payment computation is complex as it is based on prevailing rates, your existing loan and your new loan. Also, a part of this payment may be prorated, for example, as reimbursement for a portion of your loan origination fees and mortgage points.

To be eligible to receive this payment, the acquired property must have been encumbered by a bona fide mortgage that was a valid lien for at least 180 days prior to the initiation of negotiations.

You may also be reimbursed for any actual and necessary **Incidental Expenses** that you incur in relation to the purchase of your replacement property. These expenses may be those costs for title search, recording fees, credit report, appraisal report, and certain other closing costs associated with the purchase of property. You will not be reimbursed for any recurring costs such as prepaid real estate taxes and property insurance.

If the total amount of your **Replacement Housing Payment** (Price Differential, Mortgage Differential and Incidental Expenses) exceeds $22,500, the payment must be deposited directly into an escrow account or paid directly to the mortgage company.

EXAMPLES OF PRICE DIFFERENTIAL PAYMENT COMPUTATION

SCENARIO 1: If you ***owned and occupied the mobile home for at least 180 days,*** and it's on ***your own property,*** and the Authority ***acquires your mobile home,*** then you are entitled to receive a **Price Differential** based on a comparable residential property.

Assume that the Authority purchases your property and mobile home for $98,000. After a thorough study of available, decent, safe and sanitary dwellings on the open market, the Authority determines that a comparable replacement property, a mobile home on a similar size lot, will cost you $100,000. If your purchase price of the replacement property is $100,000, you will receive $2,000 *(see Example A).*

If your actual purchase price is more than $100,000, you pay the difference (see *Example B).* If your actual purchase price is less than $100,000, the differential payment will be based on actual costs *(see Example C).*

Remember: You do not have to purchase another mobile home as your replacement property.

How much of a differential payment you receive depends on how much you actually spend on a replacement dwelling as shown in these examples:

The Authority's Computation

Cost of Comparable Replacement Mobile Home:	$100,000
Acquisition Price of Your Mobile Home:	-$ 98,000
Maximum Price Differential	$ 2,000

Example A

Purchase Price of Replacement Mobile Home:	$100,000
Cost of Comparable Replacement Mobile Home:	$100,000
Acquisition Price of Your Mobile Home:	-$ 98,000
Maximum Price Differential	$ 2,000

Example B

Purchase Price of Replacement Mobile Home:	$105,000
Cost of Comparable Replacement Mobile Home:	$100,000
Acquisition Price of Your Mobile Home:	- $ 98,000
Maximum Price Differential	$ 2,000
You Must Pay the Additional	$ 5,000

Example C

Cost of Comparable Replacement Mobile Home:	$100,000
Purchase Price of Replacement Mobile Home:	- $ 99,000
Acquisition Price of Your Mobile Home:	$ 98,000
Price Differential	$ 1,000

In Example C you will only receive $1,000, not the full amount of the Authority's "Comparable Replacement Property," because of the "Spend to Get" requirements.

SCENARIO 2: If you ***owned and occupied the mobile home for at least 180 days,*** and it's on ***your own property,*** and the Authority DOES NOT ***acquire your mobile home,*** then you are entitled to receive a **Price Differential** based on a comparable residential property on which you can relocate your mobile home.

Assume that the Authority purchases your land for $48,000. After a thorough study of available locations for purchase that can accommodate the mobile home unit that you retained (which will be moved by a qualified mover), the Authority determines that a comparable replacement piece of land will cost you $51,000. If your actual purchase price is $51,000, you will receive $3,000 *(see Example A).*

If your actual purchase price is more than $51,000, you pay the difference (see *Example B).* If your actual purchase price is less than $51,000, the differential payment will be based on actual costs *(see Example C)*

Remember: You do not have to buy a replacement piece of land for your mobile home. You can sell your mobile home to a private party, and purchase a single family residence. However, your RHP will be based on the replacement value of the land.

How much of a differential payment you receive depends on how much you actually spend on a replacement dwelling as shown in these examples:

The Authority's Computation

Comparable Replacement Land:	$ 51,000
Acquisition Price of Your Land:	- $ 48,000
Maximum Price Differential:	$ 3,000

Example A

Purchase Price of Replacement Land:	$ 51,000
Comparable Replacement Land:	$ 51,000
Acquisition Price of Your Land:	-$ 48,000
Maximum Price Differential	$ 3,000

Example B

Purchase Price of Replacement Land:	$ 55,000
Comparable Replacement Land:	$ 51,000
Acquisition Price of Your Land:	-$ 48,000
Maximum Price Differential:	$ 3,000
You Must Pay the Additional:	$ 4,000

Example C

Comparable Replacement Property:	$ 51,000
Purchase Price of Replacement:	$ 49,500
Acquisition Price of Your Property:	- $ 48,000
Price Differential	$ 1,500

In Example C you will only receive $1,500 - not the full amount of the Authority's "Comparable Replacement Property" because of the "Spend to Get" requirements.

SCENARIO 3: If you ***owned and occupied the mobile home for at least 180 days,*** and it's on land that you rent (e.g. a mobile home park), and the Authority DOES NOT ***acquire your mobile home,*** you may be entitled to a **Rent Differential** based on a comparable piece of land.

However, if the Authority acquires your mobile home because it cannot be moved, it is not considered "decent, safe and sanitary," there are no comparable replacement locations, or available mobile home parks will not accept it because of its size or condition, you may be entitled to a **Price Differential** for the mobile home plus a **Rent Differential** for the land you rent in the Mobile Home Park.

Assume that for $38,000, the Authority purchases your mobile home that is located in a Mobile Home Park where you pay $400 per month for rent (which includes heat, lights, water, garbage, and sewer). The Authority conducts a thorough study of available pieces of land for rent that can accommodate a mobile home unit **and** determines the purchase price of a comparable mobile home unit. An example of your entitlement might be:

The Authority's Computation

Comparable replacement land for rent:	$ 500
Rent you currently pay at the mobile home park:	$ 400
Monthly difference:	$ 100
Multiplied times 42 months = Maximum Rent Differential:	$ 4,200

IF you spend at least $500 per month at the new location.

PLUS:

Comparable Replacement Mobile Home for purchase	$ 42,000
Acquisition Price of Mobile Home you occupy	$ 38,000
Maximum Price Differential:	$ 4,000

IF you pay at least $42,000 for a new mobile home to be set up at the new mobile home park

If you are a "180 day owner occupant," in order to receive the full amount of the Replacement Housing Payment *(Price Differential, Mortgage Differential and Incidental Expenses),* **you must:**

A) Purchase and occupy a DS&S replacement dwelling within one year after the later of:

1. The date you first receive a notification of an available replacement residential property (e.g., mobile home on an existing location, land available for your mobile home, or another type of residential unit), **OR**

2. The date that the Authority has paid the acquisition cost of your mobile home and/or land (usually the closing of escrow on the Authority's acquisition),

AND

B) Spend at least the amount of the Authority's "Comparable Replacement Property" for a replacement property,

AND

C) File a claim for relocation payments within 18 months of the later:

1. The date you vacate the property acquired by the Authority, **OR**

2. The date that the Authority has paid the acquisition cost of your current dwelling (usually the close of escrow on the Authority's acquisition).

You will not be eligible to receive any relocation payments until the Authority has actually made the first written offer to purchase the property. Also, you will receive at least 90 days' written notice before you must move.

FOR OWNER OCCUPANTS AND TENANTS OF 90 DAYS OR MORE

If you qualify as a 90-day occupant (either as an owner or tenant), you may be eligible for a Replacement Housing Payment in the form of a Rent Differential. Remember, it is your status in the mobile home unit that determines your "occupancy."

The **Rent Differential** payment is designed to assist you in renting a comparable decent, safe and sanitary replacement dwelling. The payment is based on the difference between the base monthly rent for the property acquired by the Authority (including average monthly cost for utilities) and the lesser of:

a. The monthly rent and estimated average monthly cost of utilities for a comparable replacement dwelling as determined by the Authority, **OR**

b. The monthly rent and estimated average monthly cost of utilities for the decent, safe and sanitary dwelling that you actually rent as a replacement dwelling.

Utility costs are those expenses you incur for heat, lights, water and sewer regardless of the source (e.g., electricity, propane, and septic system). It does not include garbage, cable, telephone, or security. The cost of utilities at your property is based on the average costs over the last 12 months. The cost of utilities at the comparable replacement property is based on the estimated costs for the last 12 months for the type of dwelling and area used in the calculation.

This difference between (a) and (b) is multiplied by 42 months and may be paid to you in a lump sum payment or in periodic installments in accordance with policy and regulations.

In order to receive the full amount of the calculated Rent Differential, you must spend at least the amount calculated by the Authority on a replacement property. (spend to get)

This payment may, with certain limitations, be converted to a **Downpayment Option** to assist you in purchasing a replacement property. (See page 12 for a full explanation).

Examples of Replacement Housing Payments for 90 day occupants:

Situation 1: You ***owned and occupied*** the mobile home unit and the land for at least 90 days but not more than 180 days. You are entitled to a **Rent Differential** based on the difference between the economic rent of your home (the unit and the land) and that of a comparable home (the unit and the land) that is available for rent.

If you move the mobile home, you are entitled to a **Rent Differential** based on the difference between the economic rent of the mobile home site and that of a comparable mobile home site that is available for rent.

Situation 2: You ***rented and occupied*** for at least 90 days the mobile home unit that was located on land you owned. You are entitled to a **Rent Differential** based on the difference between the actual rent of your mobile home plus the economic rent of the mobile home site, and that of a comparable mobile home (the unit and site) that is available for rent.

Situation 3: You ***rented and occupied the*** mobile home and the land for at least 90 days. You are entitled to a **Rent Differential** based on the difference between the actual rent of the mobile home unit (including utilities) and the land, and that of a comparable home (the unit and the land) that is available for rent.

Situation 4: You ***owned and occupied*** the mobile home for at least 90 days, on land that you rented. You are entitled to a **Rent Differential** based on the difference between the economic rent of the mobile home PLUS the actual rent of the mobile home site, and the cost of a comparable mobile home (the unit and site) that is available for rent.

If you move the mobile home, you are entitled to a **Rent Differential** based on the difference between the actual or economic rent of the mobile home site and that of a comparable mobile home site that is available for rent.

If you are a "90 day owner occupant," in order to receive the full amount of your Replacement Housing Payment *(Rent Differential), you* **must:**

A) Rent and occupy a DS&S replacement dwelling within one year after the later of:

1. The date you first receive a notification of an available replacement dwelling, **OR**

2. The date you vacate the property acquired by the Authority, **AND**

B) Spend at least the amount of the Authority's "Comparable Replacement Property" to rent a replacement property,

AND

C) File a claim for relocation payments within 18 months of the later of:

1. The date you vacate the property acquired by the Authority, **OR**

2. The date that the Authority has paid the acquisition cost of your current dwelling (usually the close of escrow on the Authority's acquisition).

If you are a "90 day occupant," in order to receive the full amount of your Replacement Housing Payment *(Rent Differential), you* **must:**

A) Rent and occupy a DS&S replacement dwelling within one year after day you vacate the property acquired by the Authority,

AND

B) Spend at least the amount of the Authority's "Comparable Replacement Property" to rent a replacement property,

AND

C) File a claim for relocation payments within 18 months of the day you vacate the property acquired by the Authority.

You will not be eligible to receive any relocation payments until the Authority has actually made the first written offer to purchase the property. Also, you will receive at least 90 days' written notice before you must move.

DOWNPAYMENT OPTION

The Rent Differential payment may, with certain limitations, be converted to a **Downpayment Option** to assist you in purchasing a replacement property. The Downpayment Option is a direct conversion of the Rent Differential payment.

If the Authority's calculated Rent Differential is between $0 and $5,250, your downpayment will be $5,250 which can be used towards the purchase of a replacement decent, safe and sanitary dwelling.

If the Rent Differential is over $5,250, you may be able to convert the entire amount of the Rent Differential to a Downpayment Option.

The Downpayment Option must be used for the required downpayment, which is usually a percentage of the entire purchase price, plus any eligible incidental expenses *(see page 10; 180-day Owner Occupants Incidental Expenses)* related to the purchase of the property. You must work closely with your Relocation Agent to ensure you can utilize the full amount of your Downpayment Option towards the purchase.

If any portion of the Rent Differential was used prior to the decision to convert to a downpayment, those advance payments will be deducted from the entire benefit.

LAST RESORT HOUSING

On most projects, an adequate supply of housing will be available for sale and for rent, and the benefits provided will be sufficient to enable you to relocate to comparable housing. However, there may be projects in certain locations where the supply of available housing is insufficient to provide the necessary housing for those persons being displaced. In such cases, the Authority will utilize a method called Last Resort Housing. Last Resort Housing allows the Authority to construct, rehabilitate or modify housing in order to meet the needs of the people displaced from a project. The Authority can also pay above the statutory limits of $5,250 and $22,500 in order to make available housing affordable.

RELOCATION ADVISORY ASSISTANCE

Any owner or occupant of a mobile home displaced by the Authority shall be offered relocation advisory assistance for the purpose of locating a replacement property. Relocation services are provided by qualified personnel employed by, or under contract with, the Authority. It is their goal and desire to be of service to you and assist in any way possible to help you successfully relocate.

A Relocation Agent from the Authority will contact you personally. Relocation services and payments will be explained to you in accordance with your eligibility. During the initial interview with you, your housing needs and desires will be determined as well as your need for assistance. You cannot be required to move unless at least one comparable replacement dwelling is made available to you. You can expect to receive the following services, advice and assistance from your Relocation Agent who will:

- Explain the relocation benefits and eligibility requirements.
- Provide the amount of the replacement housing payments in writing.
- Assure the availability of a comparable property before you move.
- Inspect possible replacement residential units for DS&S compliance.
- Provide information on counseling you can obtain to help minimize hardships in adjusting to your new location.
- Assist you in completing loan documents, rental applications or Relocation claims.

AND provide information on:

- Security deposits
- Interest rates and terms
- Typical down payments
- VA and FHA loan requirements
- Real and personal property taxes
- Qualified mobile home movers, including disassembly and reassembly
- Mobile Home Park requirements and fees
- Consumer education literature on housing

If you desire, your Relocation Agent will give you current listings of other available replacement housing. Transportation will be provided to inspect available housing, especially if you are elderly or handicapped. Though you may use the services of a real estate broker, the Authority cannot provide a referral.

Your Relocation Agent is familiar with the services provided by others in your community and will provide information on other federal, state, and local housing programs offering assistance to displaced persons. If you have special problems, your Relocation Agent will make every effort to secure the services of those agencies with trained personnel who have the expertise to help you.

If the high-speed rail project will require a considerable number of people to be relocated, the Authority may establish a temporary Relocation Field Office on or near the project. Project relocation offices will be open during convenient hours and evening hours if necessary.

In addition to these services, the Authority is required to coordinate its relocation activities with other agencies causing displacements to ensure that all persons displaced receive fair and consistent relocation benefits.

Remember: YOUR RELOCATION AGENT is there to offer advice and assistance. Do not hesitate to ask questions. And be sure you fully understand all of your rights and available benefits.

YOUR RIGHTS AS A DISPLACEE

All eligible displacees have a ***freedom of choice*** in the selection of replacement housing, and the Authority will not require any displaced person to accept a replacement dwelling provided by the Authority. If you decide not to accept the replacement housing offered by the Authority, you may secure a replacement dwelling of your choice, providing it meets DS&S housing standards. The Authority will not pay more than your calculated benefits on any replacement property.

The most important thing to remember is that the replacement dwelling you select must meet the basic "decent, safe, and sanitary" standards. ***Do not execute a purchase agreement or a rental agreement*** until a representative from the Authority has inspected and certified in writing that the dwelling you propose to occupy meets the basic standards. ***DO NOT jeopardize*** your right to receive a replacement housing payment by moving into a substandard dwelling.

It is important to remember that your relocation benefits will ***not have an adverse*** affect on your:

- Social Security Eligibility
- Welfare Eligibility
- Income Taxes

In addition, **Title VIII of the Civil Rights Act of 1968** and later acts and amendments make discriminatory practices in the purchase and rental of most residential units illegal if based on race, color, religion, sex, or national origin.

Whenever possible, minority persons shall be given reasonable opportunities to relocate to decent, safe, and sanitary replacement dwellings, not located in an area of minority concentration, and that is within their financial means. This policy, however, does not require the Authority to provide a person a larger payment than is necessary to enable a person to relocate to a comparable replacement dwelling.

The Authority's **Non-Discrimination Policy** ensures that all services and/or benefits will be administered to the general public without regard to race, color, national origin, or sex in compliance with Title VI of the 1964 Civil Rights Act (42 USC, sec. 2000d. et seq.).

And you always have the **Right to Appeal** any decision by the Authority regarding your relocation benefits and eligibility. Your Right of Appeal is guaranteed in the Uniform Act which states that any person may file an appeal with the head of the responsible agency if that person believes that the agency has failed to properly determine the person's eligibility or the amount of a payment authorized by the Act.

If you indicate your dissatisfaction, either verbally or in writing, the Authority will assist you in filing an appeal and explain the procedures to be followed. You will be given a prompt and full opportunity to be heard. You have the right to be represented by legal counsel or other representative in connection with the appeal (but solely at your own expense). The Authority will consider all pertinent justifications and materials submitted by you and other available information needed to ensure a fair review. The Authority will provide you with a written determination resulting from the appeal with an explanation of the basis for the decision. If you are still dissatisfied with the relief granted, the Authority will advise you that you may seek judicial review.

and Implementing Regulations (49 C.F.R. Part 24)

CALIFORNIA High-Speed Rail Authority

Your Rights and Benefits as a Displacee Under the Uniform Relocation Assistance Program ***(Business, Farm or Nonprofit Organization)***

July 2013

www.hsr.ca.gov

INTRODUCTION

In building any large, modern transportation project, the displacement of a small percentage of the population is often necessary. However, it is the policy of the California High-Speed Rail Authority (Authority) that displaced persons shall not suffer unnecessarily as a result of a program, like the High-Speed Rail Project (Project), that is designed to benefit the public as a whole.

Businesses, farms, and nonprofit organizations displaced by the Project may be eligible for relocation advisory services and payments.

This brochure provides information about available relocation services and payments. If you are required to move as the result of the Project, a Relocation Agent will contact you. The Relocation Agent will be able to answer your specific questions and provide additional information.

UNIFORM RELOCATION ASSISTANCE AND REAL PROPERTY ACQUISITION POLICIES ACT OF 1970 AS AMENDED, "THE UNIFORM ACT"

The purpose of the Uniform Act is to provide for uniform and equitable treatment of persons displaced from their homes, businesses, farms or nonprofit organizations, by federal and federally assisted programs and to establish uniform and equitable land acquisition policies for federal and federally assisted programs.

Title 49, Part 24, of the Code of Federal Regulations implements the Uniform Act in accordance with the following relocation assistance objective:

To ensure that persons displaced as a direct result of federal or federally-assisted projects are treated fairly, consistently and equitably so that such persons will not suffer disproportionate injuries as a result of projects designed for the benefit of the public as a whole.

While every effort has been made to assure the accuracy of this brochure, you must understand that it does not have the force and effect of law, rule, or regulation governing the payment of benefits. In the event of any difference between a statement in this brochure and any provision of law, rule or regulation, the latter will be followed.

Relocation Services

The California-High Speed Rail Authority has two programs to aid businesses, farms and nonprofit organizations which must relocate.

These are:

1. The Relocation Advisory Assistance Program, which is to aid you in locating a suitable replacement property, and

2. The Relocation Payments Program, which is to reimburse you for certain costs involved in relocating. These payments are classified as:

    - Moving and Related Expenses (costs to move personal property not acquired).
    - Reestablishment Expenses (expenses related to the replacement property).
    - In-Lieu Payment (a fixed payment in lieu of moving and related expenses, and reestablishment expenses).

Note: *A payment for loss of goodwill is considered an acquisition cost. California law and the federal regulations mandate that relocation payments cannot duplicate other payments such as loss of goodwill. You will* **not** *be eligible to receive any relocation payments until the State has actually made the first written offer to purchase the property. You will also receive at least 90 days' written notice before you must move.*

SOME IMPORTANT DEFINITIONS

You will be able to understand your relocation benefits better if you become familiar with the following terms:

Business is any lawful activity, except a farm operation (see definition on following page), that is conducted primarily for the purchase, sale, lease and/or rental of personal and/or real property, and/or for the manufacture, processing, and/or marketing of products, commodities, and/or any other personal property, or primarily for the sale of services to the public, or primarily for outdoor advertising display purposes when the display must be moved as a result of the project, or by a nonprofit organization that has established its nonprofit status under applicable federal or state law.

Displaced Person or Displacee is any person who moves from real property or moves personal property from real property as a result of the acquisition of the real property, in whole or in part, or as the result of a written notice from the agency of its intent to acquire the real property needed for this transportation project. In the case of a partial acquisition, the Authority shall determine if a person is displaced as a direct result of the acquisition.

Owners and tenants **not lawfully present** in the United States are not eligible to receive relocation payments and assistance.

Contributes Materially means that during the two taxable years before the taxable year in which displacement occurs, a business or farm operation must have had average annual gross receipts of at least $5,000 or average annual net earnings of at least $1,000, or their income must have contributed at least 33 1/3 percent of the owner's or operator's average annual gross income from all sources, in order to qualify as a bona-fide operation.

Farm Operation is any activity conducted solely or primarily for the production of one or more agricultural products or commodities, including timber, for sale and home use, and customarily producing such products or commodities in sufficient quantity to be capable of contributing materially to the operator's support.

Nonprofit Organization is a public or private entity that has established its nonprofit status under applicable law and is exempt from paying federal income taxes.

MOVING EXPENSES

If you qualify as a displaced business, farm or nonprofit organization, you are entitled to reimbursement of your moving costs and certain related expenses incurred in moving. To qualify you must legally occupy the property as the owner or lessee/tenant when the Authority initiates negotiations for the acquisition of the property **or** at the time the Authority acquires title or takes possession of the property. However, to assure your eligibility and prompt payment of moving expenses, you should contact your Relocation Agent before you move.

You Can Choose Either:

Actual Reasonable Moving Costs. You may be paid for your actual reasonable moving costs and related expenses when a commercial mover performs the move. Reimbursement will be limited to a move of 50 miles or less. Related expenses, with limitations, ***may*** include:

- Transportation
- Packing and unpacking of personal property
- Disconnecting and reconnecting personal property related to the operation
- Temporary storage of personal property

- Insurance while property is in storage or transit, or the loss and damage of personal property if insurance is not reasonably available
- Expenses in finding a replacement location
- Professional services to plan and monitor the move of the personal property to the new location
- Licenses, permits and fees required at the replacement location

OR

Self-Move Agreement. You may be paid to move your own personal property based on the lower of two acceptable bids obtained by the Authority. Under this option, you will still be eligible for reimbursement of related expenses listed above that were not included in the bids.

OR

In-Lieu Payment. You can accept a fixed payment between $1,000 and $20,000, based on your annual earnings **in lieu of,** that is, **in place of** the moving cost, related expenses and reestablishment cost.

Actual Reasonable Moving Costs:

You may be paid the actual reasonable and necessary costs of your move when a professional mover performs the move. All of your moving costs must be supported by paid receipts or other evidence of expenses incurred. In addition to the transportation costs of your personal property, certain other expenses may also be reimbursable, such as packing, crating, unpacking and uncrating, and the disconnecting, dismantling, removing, reassembling, and reinstalling of relocated machinery, equipment, and other personal property.

Other expenses such as professional services necessary for planning and carrying out the move, temporary storage costs, and the cost of licenses, permits and certifications may also be reimbursable. This is not intended to be an all-inclusive list of moving related expenses. Your Relocation Agent can provide you with a complete explanation of reimbursable expenses.

Self-Move Agreement:

If you agree to take full responsibility for all or part of the move of your business, farm, or nonprofit organization, the Authority may approve a payment not to exceed the lower of two acceptable bids obtained by the Authority from qualified moving firms or a qualified Authority agent. A low-cost or uncomplicated move may be based on a single bid or estimate at the Authority's discretion. The advantage of this moving option is that it relieves the displaced business, farm or nonprofit organization operator from documenting all moving expenses. The Authority may make the payment without additional documentation as long as the payment is limited to the amount of the lowest acceptable bid or estimate. Other expenses, such as professional services for planning, storage costs, and the cost of licenses, permits, and certifications may also be reimbursable if determined to be necessary. These latter expenses must be pre-approved by the Relocation Agent.

Requirements:

Before you move, you must provide the Authority with the:

- Certified inventory of all personal property to be moved
- Date you intend to vacate the property
- Address of the replacement property
- Opportunity to monitor and inspect the move from the acquired property to the replacement property.

Related Expenses:

1. Searching Expenses for Replacement Property. Displaced businesses, farms and nonprofit organizations are entitled to reimbursement for actual reasonable expenses incurred in searching for a replacement property, not to exceed $2,500. Expenses may include transportation, meals, and lodging when away from home; the reasonable value of the time spent during the search; fees paid to the real estate agents, brokers or consultants; and other expenses determined to be reasonable and necessary by the Authority.

2. Direct Loss of Tangible Personal Property. Displaced businesses, farms, and nonprofit organizations may be eligible for a payment for the actual direct loss of tangible personal property which is incurred as a result of the move or discontinuance of the operation. This payment will be based upon the **lesser of**:

a. The fair market value of the item for continued use at the displacement site minus the proceeds from its sale.

OR

b. The estimated cost of moving and reinstalling the replaced item, based on the lowest acceptable bid or estimate obtained by the Authority for eligible moving and related expenses, including dismantling and reassembly, but with no allowance for storage, cost of code requirement betterments or upgrades at the replacement site.

EXAMPLE:

You determine that the “document shredder” cannot be moved to the new location because of its condition, and you will not replace it at the new location.

Fair market value of the document shredder based on its use at the current location	$ 1,500
Proceeds: Price received from selling the document shredder	- $ 500
Net Value	$ 1,000

OR

Estimated cost to move	$ 1,050

Based on the lesser of the two, the amount of the payment for Loss of Tangible Personal Property	= **$ 1,000**

Note: You are also entitled to all reasonable costs incurred in attempting to sell the document shredder (e.g. advertisement).

3. Purchase of Substitute Personal Property. If an item of personal property, which is used as part of the business, farm, or nonprofit organization, is not moved but is promptly replaced with a substitute item that performs a comparable function at the replacement site, the displacee is entitled to payment of the **lesser of**:

a. The cost of the substitute item, including installation costs at the replacement site, minus any proceeds from the sale or trade-in of the replaced item;

OR

b. The estimated cost of moving and reinstalling the replaced item, based on the lowest acceptable bid or estimate obtained by the Authority for eligible moving and related expenses, including dismantling and reassembly, but with no allowance for storage, cost of code requirement betterments or upgrades at the replacement site.

EXAMPLE:

You determine that the copying machine cannot be moved to the new location because it is now obsolete and you will replace it.

Cost of a substitute copy machine including installation costs at the replacement site	$ 3,000
Trade-in Allowance	- $ 2,500
Net Value	$ 500

OR

Estimated cost to move	$ 550

Based on the lesser of the above, the amount of the payment for Substitute Personal Property	= **$ 500**

You determine that the chairs will not be used at the new location because they no longer match the decor and you will replace them.

Cost of substitute chairs	$ 1,000
Proceeds from selling the chairs	- $ 100
Net Value	$ 900

OR

Estimated cost to move	$ 200

Based on the lesser of the above, the amount of the payment for Substitute Personal Property	= **$ 200**

Note: *You are also entitled to all reasonable costs incurred in attempting to sell the copy machine and/or chairs.*

4. Disconnecting and Reinstallation. You will be reimbursed for your actual and reasonable costs to disconnect, dismantle, remove, reassemble and reinstall any machinery, equipment or other personal property in relation to its move to the new location. This includes connection to utilities available nearby and any modifications to the personalty that are necessary to adapt it to the utilities at the replacement site.

5. Physical changes at the new location. You may be reimbursed for certain physical changes to the replacement property if the changes are necessary to permit the reinstallation of machinery or equipment necessary for the continued operation of the business.

Note: *The changes cannot increase the value of the building for general purposes, nor can they increase the mechanical capability of the buildings beyond its normal requirements.*

6. The cost of installing utilities from the right of way line to the structure(s) or improvements on the replacement site.

7. The reasonable cost of marketing studies, feasibility surveys and soil testing.

8. The reasonable cost of professional real estate services needed for the purchase or lease of a replacement site.

9. The amount of one-time assessments or impact fees for anticipated heavy utility usage.

REESTABLISHMENT EXPENSES

A small business, farm or nonprofit organization may be eligible for a payment, not to exceed $10,000, for expenses actually incurred in relocating and reestablishing the enterprise at a replacement site.

Reestablishment expenses may include, but are not limited to, the following:

1. Repairs or improvements to the replacement real property required by federal, state or local laws, codes or ordinances.

2. Modifications to the replacement real property to make any structures suitable for the business operation.

3. Construction and installation of exterior signing to advertise the business.

4. Redecoration or replacement such as painting, wallpapering, paneling or carpeting when required by the condition of the replacement site or for aesthetic purposes.

5. Advertising the new business location.

6. The estimated increased costs of operation at the replacement site during the first two years, for items such as:

    a) Lease or rental charges

    b) Personal or real property taxes

    c) Insurance premiums, and

    d) Utility charges (excluding impact fees).

7. Other items that the Authority considers essential for the reestablishment of the business or farm.

Note: *A nonprofit organization must substantiate that it cannot be relocated without a substantial loss of existing patronage (membership or clientele). The payment is based on the average of two years annual gross revenues less administrative expenses.*

IN-LIEU PAYMENT (FIXED)

Business - Displaced businesses may be eligible for a fixed payment in lieu of (in place of) actual moving expenses, personal property losses, searching expenses, and reestablishment expenses. The fixed payment may not be less than $1,000 or more than $20,000.

For a business to be eligible for a fixed payment, the Authority must determine the following:

1. The business owns or rents personal property that must be moved due to the displacement.

2. The business cannot be relocated without a substantial loss of existing patronage.

3. The business is not part of a commercial enterprise having more than three other businesses engaged in the same or similar activity and which are under the same ownership and are not being displaced by the Authority.

4. The business contributed materially to the income of the displaced business operator during the two taxable years prior to displacement. Any business operation that is engaged solely in the rental of space to others is not eligible for a fixed payment. This includes the rental of space for residential or business purposes.

Farm Operation – Displaced farm operations may be eligible for a fixed payment in lieu of (in place of) actual moving expenses, personal property losses, searching expenses, and reestablishment expenses. The fixed payment may not be less than $1,000 or more than $20,000. In the case of a partial acquisition of land, which was a farm operation before the acquisition, the fixed payment shall be made only if the Authority determines that:

1. The acquisition of part of the land caused the operator to be displaced from the farm operation on the remaining land; or

2. The partial acquisition caused a substantial change in the nature of the farm operation.

Eligibility requirements for nonprofit organizations are slightly different from eligibility requirements for businesses and farm operations. If you represent a nonprofit organization that is being displaced and are interested in a fixed payment, please consult your Relocation Agent for additional information.

The Computation of Your In-Lieu Payment:

The fixed payment for a displaced business or farm is based upon the average annual net earnings of the operation for the two taxable years immediately preceding the taxable year in which it is displaced. The Authority may use a different two year period if it is determined that the last two taxable years do not accurately reflect the earnings of the operation.

EXAMPLE: The Authority acquires your property and you move in 2011:

2009 Annual Net Earnings	$10,500
2010 Annual Net Earnings	$ 12,500
TOTAL	$ 23,000
Average over two years	**$ 11,500**

This two-year average would be the amount of your in-lieu payment.

Remember: This payment is in place of all other moving benefits, including reestablishment expenses. You must provide the Authority with proof of net earnings to support your claim.

Proof of net earnings can be documented by income tax returns, certified financial statements, or other reasonable evidence of net earnings acceptable to the Authority.

Note: The computation for nonprofit organizations differs in that the payment is computed on the basis of average annual gross revenues less administrative expenses for the two year period specified above.

Before You Move:

A. Request a determination of entitlement for in-lieu payment from your Relocation Agent.

B. Include a written statement of the reasons the business cannot be relocated without a substantial loss in net earnings.

C. Provide certified copies of tax returns for the two tax years immediately preceding the tax year in which you move. For example, if you move anytime in the year 2012, regardless of when negotiations began or the Authority took title to the property, the taxable years would be 2010 and 2011.

D. You will be notified of the amount you are entitled to after the application is received and approved,

E. You cannot receive the payment until after you vacate the property, AND submit a claim for the payment within 18 months of the date of your move.

RELOCATION ADVISORY ASSISTANCE

Any business, farm or nonprofit organization displaced by the Authority shall be offered relocation advisory assistance for the purpose of locating a replacement property. Relocation services are provided by qualified personnel employed by, or under contract with, the Authority. It is their goal and desire to be of service to you and to assist in any way possible to help you relocate successfully.

A Relocation Agent from the Authority will contact you personally. Relocation services and payments will be explained to you in accordance with your eligibility. During the Agent's initial interview with you, your needs and preferences will be determined as well as your need for assistance.

You can expect to receive the following services, advice and assistance from your Relocation Agent who will:

- Determine your needs and preferences.
- Explain the relocation benefits and eligibility requirements.
- Provide information on replacement properties for your consideration.
- Provide information on counseling you can obtain to help minimize hardships in adjusting to your new location.
- Assist you in completing loan documents, rental applications or relocation claims forms.

AND will provide information on:

- Security deposits
- Interest rates and terms
- Typical downpayments
- Permits, fees and local planning
- SBA loan requirements
- Real property taxes
- Consumer education literature

If you desire, your Relocation Agent will give you current listings of other available replacement property. Transportation will be provided to inspect available property, especially if you are elderly or handicapped. Although you may use the services of a real estate broker, the Authority cannot provide a referral.

Your Relocation Agent is familiar with the services provided by others in your community and will provide information on other federal, state, and local programs offering assistance to displaced persons. If you have special needs, your Relocation Agent will make every effort to secure the services of those agencies with trained personnel who have the expertise to help you.

If the high-speed rail project will require a considerable number of people to be relocated, the Authority may establish a temporary Relocation Field Office on or near the project. Project relocation offices will be open during convenient hours and evening hours if necessary.

In addition to these services, the Authority is required to coordinate its relocation activities with other agencies causing displacements to ensure that all persons displaced receive fair and consistent relocation benefits.

Remember: YOUR RELOCATION AGENT is there to offer advice and assistance. Do not hesitate to ask questions. And be sure you fully understand all of your rights and available benefits.

YOUR RIGHTS AS A DISPLACEE

It is important to remember that your relocation benefits will not have an adverse effect on your:

- Social Security Eligibility
- Welfare Eligibility
- Income Taxes

In addition, Title VIII of the Civil Rights Act of 1968 and later acts and amendments make discriminatory practices in the purchase and rental of most residential units illegal if based on race, color, religion, sex, or national origin.

The Authority's Non-Discrimination Policy ensures that all services and/or benefits will be administered to the general public without regard to race, color, national origin, or sex in compliance with Title VI of the 1964 Civil Rights Act (42 USC, sec. 2000d, et seq.).

And you always have the right to appeal any decision by the Authority regarding your relocation benefits and eligibility.

Your right to appeal is guaranteed in the Uniform Act which states that any person may file an appeal with the head of the responsible agency if that person believes that the agency has failed to determine properly the person's eligibility or the amount of a payment authorized by the Act.

If you indicate your dissatisfaction, either verbally or in writing, the Authority will assist you in filing an appeal and explain the procedures to be followed. You will be given a prompt and full opportunity to be heard. You have the right to be represented by legal counsel or other representative in connection with the appeal (but solely at your own expense).

The Authority will consider all pertinent justifications and materials submitted by you and other available information needed to ensure a fair review. The Authority will provide you with a written determination resulting from the appeal with an explanation of the basis for the decision. If you are still dissatisfied with the relief granted, the Authority will advise you that you may seek judicial review.

Tables 1a through 1d show the acres of Important Farmland that would be permanently converted by the San Jose to Merced Project Section alternatives (project alternatives) by individual assessor's parcel number (APN). Tables 2a through 2d show the acres of Important Farmland that would be temporarily used by the project alternatives by individual APN.[1]

[1] Total acreages do not exactly match total acreages presented in the *California High-Speed Rail San Jose to Merced Project Section Agricultural Farmland Technical Report* or EIR/EIS Section 3.14, Agricultural Farmland. This is because the county parcel data presented in this appendix include some road gaps and parcel overlaps at county boundaries between parcels in the detailed parcel-level analysis, whereas the acreages presented in the technical report and Section 3.14 analysis are based on continuous data with no gaps for roads or overlaps at county boundaries. While the data sets do not match, they both are accurate calculations based on the underlying data and corresponding calculations from each dataset are accurate.

Table 1a Parcels of Important Farmland Permanently Converted under Alternative 1 (acres)

APN	Prime Farmland	Farmland of Statewide Importance	Unique Farmland	Farmland of Local Importance
San Jose Diridon Station Approach				
No parcels of Important Farmland would be permanently converted.				
Monterey Corridor				
No parcels of Important Farmland would be permanently converted.				
Morgan Hill and Gilroy

APPENDIX 3.14-B: RESULTS AND FINDINGS OF LAND EVALUATION AND SITE ASSESSMENT PURSUANT TO THE FARMLAND PROTECTION POLICY ACT

Appendix 3.14-B: RESULTS AND FINDINGS OF LAND EVALUATION AND SITE ASSESSMENT PURSUANT TO THE FARMLAND PROTECTION POLICY ACT

This appendix summarizes the results of the farmland Land Evaluation and Site Assessment (LESA) for the San Jose to Central Valley Wye Project Section (Project Section), which was performed in compliance with Farmland Protection Policy Act (FPPA) requirements. The purpose of the FPPA is to minimize the extent to which federal programs contribute to the unnecessary and irreversible conversion of farmland to nonagricultural uses (7 United States Code § 4201). Specifically, the FPPA requires that federal agencies:

- Use criteria (described in this appendix) to identify and take into account the adverse impacts of their programs on the preservation of farmland.
- Consider alternative actions, as appropriate, that could lessen adverse impacts.
- Make sure that their programs, to the extent practicable, are compatible with state and local government and private programs and policies to protect farmland.

San Jose to Central Valley Wye Project Alternatives

The four San Jose to Central Valley Wye project alternatives evaluated in the main body of this technical report (the *San Jose to Merced Project Section Agricultural Farmland Technical Report* or Agricultural Farmland Technical Report) would pass through five subsections (San Jose Diridon Station Approach, Monterey Corridor, Morgan Hill and Gilroy, Pacheco Pass, and San Joaquin Valley) and three counties (Santa Clara, San Benito, and Merced Counties). Calculations and results from the Natural Resources Conservation Service (NRCS) are reported by county. Therefore, results for each alternative discuss each county separately.

Land Evaluation and Site Assessment

As required by the FPPA implementing regulations (7 Code of Federal Regulations Part 658), NRCS staff and high-speed rail (HSR) system analysts performed LESA calculations using the CPA-106 form (for corridor-type projects) to determine an overall farmland conversion score.[1] Using alignment information provided by a geographic information system (GIS), the NRCS calculated the relative value of each of the alternative corridors as farmland; the NRCS land evaluation calculations and the Farmland Mapping and Monitoring Program site assessment criteria are presented in Attachment 1, Natural Resources Conservation Service Land Evaluation Explanations and Calculations—Santa Clara County; Attachment 2, Natural Resources Conservation Service Land Evaluation Explanations and Calculations—San Benito County; and Attachment 3, Natural Resources Conservation Service Land Evaluation Explanations and Calculations—Merced County. The NRCS provided separate scores for each county.

When the NRCS provided land evaluation scores, analysts calculated site assessment scores for each alternative. Analysts determined the total LESA rating by adding the land evaluation score (up to 100 points) and site assessment scores (up to 160 points) for each county and weighting scores based on the percentage of the alternative lying within each county (total possible score of 260 points). Analysts then compared the results to significance thresholds established in the FPPA implementing regulations. After determining total LESA scores, the analysts evaluated farmland effects and assessed relative suitability of sites for farmland protection.

The U.S. Department of Agriculture recommends that:

1. Sites[2] with the highest combined scores be regarded as most suitable for protection and the sites with the lowest scores as least suitable for protection.

[1] In the CPA-106 form, note that Corridor A corresponds to Alternative 1, Corridor B corresponds to Alternative 2, Corridor C corresponds to Alternative 3, and Corridor D corresponds to Alternative 4..

[2] Because the project is a linear project, the LESA terminology *site* refers to *corridor* or *alignment*.

2. Sites receiving a total score of less than 160 points not be given further consideration for protection and no additional sites need to be evaluated.
3. Sites receiving a total score of 160 or more points be given increasingly higher levels of consideration for protection.
4. When making decisions on proposed actions for sites receiving total scores of 160 or more points, the following should be considered:
    a. Use of land that is not farmland or use of existing structures.
    b. Alternative sites, locations, and designs that would serve the proposed purpose but would convert either fewer acres of farmland or other farmland that has a lower relative value.
    c. Special siting requirements of the project and the extent to which an alternative site fails to satisfy the special siting requirements as well as the originally selected site.

Farmland Conversion Effects Results

Table 1 shows the total LESA scores for the project alternatives (analyzed according to the portions of the alternatives in each county). All four alternatives had total LESA scores of less than 160 points in Santa Clara County, San Benito County, and Merced County.

Table 1 Land Evaluation and Site Assessment Scores for the Project Alternatives

Alternative	Relative Value of Farmland Points	Total Corridor Assessment Points	Total LESA Points
Santa Clara County			
Alternative 1	59	67	126

LESA = Land Evaluation and Site Assessment

Findings

The FPPA does not mandate that a federal agency make a specific decision based on LESA ratings but provides suitability guidance for protection of farmland from conversion to nonagricultural uses. As analyzed based on FPPA guidance, all four project alternatives received scores of less than 160 in Santa Clara, San Benito, and Merced Counties. Because all alternatives received scores of less than 160, none of the alternatives needs special consideration.

The project vicinity contains urban, suburban, rural residential, and agricultural lands. Some of California's most productive agricultural lands are located in the project vicinity, in the Southern Santa Clara Valley (County of Santa Clara 2015). San Benito County's leading industry is production agriculture (County of San Benito 2016), and Merced County in the San Joaquin Valley continues to be an important agriculture center in California and the nation (American Farmland Trust 2013). Therefore, effects on agricultural lands from the project alternatives cannot be completely avoided, although effects have been avoided and minimized to the extent feasible. The Agricultural Farmland Technical Report describes impact avoidance and minimization features that are incorporated into the project design and would avoid or minimize potential effects, including administering a farmland consolidation program to sell remnant parcels to neighboring landowners for consolidation with adjacent farmland properties for the purpose of continuing agricultural use. In addition, the Authority has proposed a mitigation measure to fund the California Department of Conservation Farmland Conservancy Program's work to identify suitable agricultural land for mitigation of effects and to fund the purchase of agricultural conservation easements from willing sellers.

The two program environmental impact reports (EIR)/environmental impact statements (EIS) for the California high-speed rail system—the *Final Program EIR/EIS for the Proposed California High-Speed Train System* (Authority and FRA 2005) and the *San Francisco Bay Area (Bay Area) to Central Valley High-Speed Train Final Program EIR/EIS* (Bay Area to Central Valley Program EIR) (Authority and FRA 2008)—and two partially revised and recirculated versions of the Bay Area to Central Valley Program EIR, the 2010 *Bay Area to Central Valley High-Speed Train Revised Final Program EIR* (Authority 2010) and the 2012 *Bay Area to Central Valley High-Speed Train Partially Revised Final Program EIR* (Bay Area to Central Valley Revised Program EIR) (Authority 2012) are collectively referred to as the Program EIR/EIS documents. The Program EIR/EIS documents recognized that effects on agricultural resources could be substantial, and some potential alternatives were rejected during the programmatic review because of their effects on agriculture. Recognizing the need to protect important agricultural resources as much as possible, the project alternatives would follow existing road and railway alignments to the extent feasible.

Natural Resources Conservation Service Land Evaluation Explanations and Calculations for Santa Clara County

APPENDIX 3.14-B, ATTACHMENT 1: NATURAL RESOURCES CONSERVATION SERVICE LAND EVALUATION EXPLANATIONS AND CALCULATIONS—SANTA CLARA COUNTY

INTRODUCTION

This attachment provides an explanation for corridor assessment points assigned to the San Jose to Central Valley Wye Project Extent (project) in part VI of the NRCS-CPA-106 form prepared for Santa Clara County. The scores indicated in the questions pertain to the portion of each project alternative that falls within Santa Clara County.

Explanations

Alternative 1

A. **Total acres to be converted directly?** The regional consultant overlaid the alternative on a map of the Farmland Mapping and Monitoring Program (FMMP) categories to determine how many acres of Important Farmland would be permanently converted by Alternative 1. The results indicate that a total of 315 acres would be permanently converted directly.

B. **Total acres to be converted indirectly or to receive services?** To determine the acreage of indirect impact, particularly the acreage of remnant and severed parcels created by the alternative, the regional consultant identified remnant parcels of Important Farmland that would be less than 20 acres. The regional consultant then reviewed each remnant to determine whether it would be viable or nonviable for continued agriculture (i.e., identified those remnants with shape, size, location, or hardship that would make them nonviable for continued agricultural use) (ARWS 2018a, 2018b, 2018c, 2018d). The results indicate that a total of 81 acres would be permanently indirectly converted as remnant or severed parcels.

C. **Total acres in corridor?** The regional consultant added the total acreage to be directly converted with the total acreage to be indirectly converted. The result indicates that a total of 396 acres would be directly and indirectly permanently converted.

1. **How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?** The regional consultant generated a buffer of 1 mile around Alternative 1 in Santa Clara County, including the temporary construction easement, to determine the total acreage of land within a 1-mile radius of the alternative in Santa Clara County. The buffer was overlaid on a map of the FMMP categories, which include Urban and Built-Up Land. For this analysis, Urban and Built-Up Land is considered urban use (DOC 2014a). Then, the acreage within the buffer that is classified as Urban and Built-Up Land was calculated using a geographic information system (GIS), and the remaining acreage was considered nonurban use. The results indicated that 65 percent of the total acreage within the buffer was nonurban use. This criterion received a score of 9.

2. **How much of the perimeter of the site borders on land in nonurban use?** The length of the perimeter of Alternative 1 in Santa Clara County, including the temporary construction easement, was measured by the regional consultant to determine the total length of the perimeter in Santa Clara County. The regional consultant then calculated the proportion of the alternative perimeter that borders on land classified as Urban and Built-Up Land, and the remaining proportion of the perimeter was considered to border nonurban use. The results indicated that 64 percent of the alternative perimeter borders on land in nonurban use. This criterion received a score of 7.

3. **How much of the site has been farmed more than 5 of the last 10 years?** According to satellite imagery analysis of the area around Alternative 1 in Santa Clara County for the years between 2005 and 2015, as well as information from the Santa Clara County Agricultural Commissioner (Deviney pers. comm.), in general, some properties in the vicinity of this alternative have been consistently farmed for 10 or more years. This criterion received a score of 13.

4. **Is the site subject to state or local government policies or programs to protect farmland or covered by private programs to protect farmland?** The area for Alternative 1 in Santa Clara County, including remnant parcels that would likely not be suitable for farming after the project is completed, was overlaid on a map of Protected Farmland (DOC 2014b), defined as lands enrolled in Williamson Act or Farmland Security Zone contracts by the regional consultant. There are 797 acres of farmlands protected by private programs such as the Williamson Act and agricultural conservation easements. The results indicated that 6 percent of the land within the project footprint in Santa Clara County is Protected Farmland. This criterion received a score of 20.
5. **Are the farm units containing the site as large as the average-size farming unit in the county?** The average size farm in Santa Clara County was 229 acres in 2012 (USDA 2012), the most recent year for which average farm size data are available. Alternative 1 traverses farm units that are an average of 30 acres, or approximately 13 percent of the size of the average farm unit in the county. This criterion received a score of 0.
6. **How much of the remaining land on the farm will become nonfarmable if this site is selected?** In some areas, the alignment of Alternative 1 deviates from transportation corridors and bisects or otherwise severs agricultural parcels. Some of the remnant parcels resulting from this severance may not be viable for continued agricultural use. The regional consultant team used GIS software to identify parcels of Important Farmland that would be 20 acres or less following severance due to construction of the project. It was assumed that parcels greater than 20 acres would be viable for continued agricultural use. Analysts then evaluated the characteristics of each of the remnant parcels of 20 acres or less using criteria described in Appendix C, Remnant Parcel Analysis, to determine which parcels would be viable for continued agricultural use and which parcels would likely result in conversion to nonagricultural use. The acreage of the remnant parcels determined not viable for continued agricultural use was compared to the acreage of the original parcels (ARWS 2018a, 2018b, 2018c, 2018d). The results indicated that the acreage of nonviable remnant parcels on farmable land would total less than 1 percent of the acreage of the original parcels within the project footprint of this alternative. This criterion received a score of 0.
7. **Does the site have available adequate supply of farm support services and markets?** According to the Santa Clara County Agricultural Commissioner (Deviney pers. comm.), the area in the vicinity of Alternative 1 has been farmed for 50 to 100 years and it has some support services and markets. There are three pesticide and fertilizer dealers within Santa Clara County; however, the majority of the farm producers procure farm services in neighboring Monterey County. This alternative would have a limited effect on farm services. This criterion received a score of 3.
8. **Does this site have substantial and well-maintained on-farm investments such as barns, fruit trees and vines, field terraces, drainage, irrigation, waterways, and other soil and water conservation measures?** According to satellite imagery analysis of the area around Alternative 1 performed by the regional consultant, the overall amount of on-farm investment is moderate. Ancillary agricultural structures, barns, fruit trees, irrigation lines, and drainage ditches were observed on the farms. Soil and water conservation measures have been applied to some of the fields. This criterion received a score of 10.
9. **Would this project, by converting the land to nonagricultural use, reduce the support for farm support services in the area?** The regional consultant overlaid the alternative on a map of the FMMP categories to determine how many acres of Important Farmland would be permanently converted by Alternative 1, plus acreage of nonviable remnant parcels less than 20 acres (i.e., those that have shape, size, location, or hardship that would make them nonviable for continued agricultural use) (ARWS 2018a, 2018b, 2018c, 2018d). Considering there are approximately 420,154 acres of Important Farmland and Grazing Land in Santa Clara County (DOC 2016), the permanent conversion of 396 acres of Important Farmland and Grazing in Santa Clara County under Alternative 1, or less than 0.1 percent of the total

Important Farmland in the County, is unlikely to result in reduction in demand for farm support services in the area. This criterion received a score of 0.

10. **Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of the surrounding farmland to nonagricultural use?** The project would include construction of the San Jose Diridon Station and a second station in either downtown Gilroy or east Gilroy, depending on the alternative selected. For Alternative 1, neither of the proposed stations would be located on prime agricultural land. The San Jose Diridon Station would be constructed at the existing Caltrain station site and the Downtown Gilroy Station would be built in an urban area. However, stations have the potential to induce population growth and farmland conversion in the long run. The construction of the Downtown Gilroy Station under Alternative 1 could induce growth in Gilroy because the station would improve the commuting options and the cost of living could draw people out of the larger, more expensive cities.

    There are two locations under consideration for a maintenance of way facility (MOWF): one is in east Gilroy and the other is in south Gilroy. For Alternative 1, south Gilroy would be the proposed location. While this site is located in an agricultural area, the MOWF would be used primarily for storage of rail vehicles and therefore would not induce growth or lead to the eventual conversion of farmland. In addition, one maintenance of infrastructure siding facility (MOIS) is proposed in Merced County west of Turner Island Road.

    Alternative 1 would involve the construction of new track, traction power substations (TPSS), and automated train control (ATC) sites. HSR track and electrical infrastructure does not have the same potential to induce growth as stations. Therefore, guideway use and power or communication facilities would be largely compatible with adjacent agriculture and would not induce urban development.

    For these reasons, it is possible that Alternative 1 would lead to eventual conversion of surrounding farmland but it would remain sufficiently compatible with existing agriculture uses. This criterion received a score of 5.

Additional Notes

Alternative 1 is the tied with Alternatives 2 and 4 for the longest length at approximately 89 miles, with 52 miles in Santa Clara County.

Alternative 2

A. **Total acres to be converted directly?** The regional consultant used the same methodology described in Question A for Alternative 1. The results indicate that a total of 461 acres would be directly permanently converted.

B. **Total acres to be converted indirectly or to receive services?** The regional consultant used the same methodology described in Question B for Alternative 1. The results indicate that a total of 162 acres would be indirectly converted.

C. **Total acres in corridor?** The regional consultant used the same methodology described in Question C for Alternative 1. The results indicate that a total of 623 acres would be directly and indirectly permanently converted.

1. **How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?** The regional consultant used the same methodology described in Criterion 1 for Alternative 1. The results indicated that 64 percent of the total acreage within the buffer was nonurban use. This criterion received a score of 9.

2. **How much of the perimeter of the site borders on land in nonurban use?** The regional consultant used same methodology described in Criterion 2 for Alternative 1. The results indicated that 61 percent of the perimeter of the alternative borders on land in nonurban use. This criterion received a score of 7.

3. **How much of the site has been farmed more than 5 of the last 10 years?** According to satellite imagery analysis of the project footprint for the years between 2005 and 2015, as well as information from the Santa Clara County Agricultural Commissioner (Deviney pers. comm.), in general, some properties in the vicinity of this alternative have been consistently farmed for 10 or more years. This criterion received a score of 3.
4. **Is the site subject to state or local government policies or programs to protect farmland or covered by private programs to protect farmland?** The regional consultant used the same methodology described in Criterion 4 for Alternative 1. There are 823 acres of farmlands protected by private programs such as the Williamson Act and agricultural conservation easements. The results indicated that 5 percent of the land within the project footprint in Santa Clara County is Protected Farmland. This criterion received a score of 20.
5. **Are the farm units containing the site as large as the average-size farming unit in the county?** The regional consultant used the same methodology described in Criterion 5 for Alternative 1. Alternative 2 traverses farm units that are an average of 29 acres, or approximately 13 percent of the size of the average farm unit in the county. This criterion received a score of 0.
6. **How much of the remaining land on the farm will become nonfarmable if this site is selected?** The regional consultant used the same methodology described in Criterion 6 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). The results indicated that the acreage of nonviable remnant parcels on farmable land would total approximately 1 percent of the acreage of the original parcels within the project footprint of this alternative. This criterion received a score of 0.
7. **Does the site have available adequate supply of farm support services and markets?** The regional consultant used the same methodology described in Criterion 7 for Alternative 1. This alternative would have a limited effect on farm services. This criterion received a score of 3.
8. **Does this site have substantial and well-maintained on-farm investments such as barns, fruit trees and vines, field terraces, drainage, irrigation, waterways, and other soil and water conservation measures?** The regional consultant used the same methods described in Criterion 8 for Alternative 1. The overall amount of on-farm investment is moderate. Ancillary agricultural structures, barns, fruit trees, irrigation lines, and drainage ditches were observed on the farms. Soil and water conservation measures have been applied to some of the fields. This criterion received a score of 12.
9. **Would this project, by converting the land to nonagricultural use, reduce the support for farm support services in the area?** The regional consultant used the same methodology described in Criterion 9 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). Considering there are approximately 420,154 acres of Important Farmland and Grazing Land in Santa Clara County (DOC 2016), the permanent conversion of 623 acres of Important Farmland and Grazing Land in Santa Clara County under Alternative 2, or less than 0.2 percent of the total Important Farmland in the County, is unlikely to result in reduction in demand for farm support services in the area. This criterion received a score of 0.
10. **Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of the surrounding farmland to nonagricultural use?** The project would include construction of the San Jose Diridon Station and a second station in either downtown Gilroy or east Gilroy, depending on the alternative selected. For Alternative 2, neither of the proposed stations would be located on prime agricultural land. The San Jose Diridon Station would be constructed at the existing Caltrain station site, and the Downtown Gilroy Station would be built in an urban area. However, stations have the potential to induce population growth and farmland conversion in the long run. The construction of the Downtown Gilroy Station could induce growth in Gilroy because the station would improve the commuting options and the cost of living could draw people out of the larger, more expensive cities.

There are also two locations under consideration for a MOWF: one is in east Gilroy and the other is in south Gilroy. For Alternative 2, south Gilroy would be the proposed location. While this site is located in an agricultural area, the maintenance facility would be used primarily for storage of rail vehicles and therefore not induce growth or lead to the eventual conversion of farmland. In addition, one MOIS facility is proposed in Merced County west of Turner Island Road.

Alternative 2 would involve the construction of new track, TPSSs, and ATC sites. HSR track and electrical infrastructure does not have the same potential to induce growth as stations. Therefore, guideway and power or communication facilities would be largely compatible with adjacent agriculture and would not induce urban development.

For these reasons, it is possible that Alternative 2 would lead to eventual conversion of surrounding farmland but it would remain sufficiently compatible with existing agriculture uses. This criterion received a score of 7.

Additional Notes

Alternative 2 is tied with Alternatives 1 and 4 for the longest length at approximately 89 miles, with 52 miles in Santa Clara County.

Alternative 3

A. **Total acres to be converted directly?** The regional consultant used the same methodology described in Question A for Alternative 1. The results indicate that a total of 475 acres would be directly permanently converted.

B. **Total acres to be converted indirectly or to receive services?** The regional consultant used the same methodology described in Question B for Alternative 1. The results indicate that a total of 169 acres would be indirectly converted.

C. **Total acres in corridor?** The regional consultant used the same methodology described in Question C for Alternative 1. The results indicate that a total of 644 acres would be directly and indirectly permanently converted.

1. **How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?** The regional consultant used the same methodology described in Criterion 1 for Alternative 1. The results indicated that 65 percent of the total acreage within the buffer was nonurban use. This criterion received a score of 9.

2. **How much of the perimeter of the site borders on land in nonurban use?** The regional consultant used same methodology described in Criterion 2 for Alternative 1. The results indicated that 68 percent of the perimeter of the alternative borders on land in nonurban use. This criterion received a score of 7.

3. **How much of the site has been farmed more than 5 of the last 10 years?** According to satellite imagery analysis of the project footprint for the years between 2005 and 2015 as well as information from the Santa Clara County Agricultural Commissioner (Deviney pers. comm.), in general, some properties in the vicinity of this alternative have been consistently farmed for 10 or more years. This criterion received a score of 5.

4. **Is the site subject to state or local government policies or programs to protect farmland or covered by private programs to protect farmland?** The regional consultant used the same methodology described in Criterion 4 for Alternative 1. There are 877 acres of farmlands protected by private programs such as the Williamson Act and agricultural conservation easements. The results indicated that 3 percent of the land within the project footprint in Santa Clara County is Protected Farmland. This criterion received a score of 20.

5. **Are the farm units containing the site as large as the average-size farming unit in the county?** The regional consultant used the same methodology described in Criterion 5 for Alternative 1. Alternative 3 traverses farm units that are an average of 25 acres, or

approximately 11 percent of the size of the average farm unit in the county. This criterion received a score of 0.

6. **How much of the remaining land on the farm will become nonfarmable if this site is selected?** The regional consultant used the same methodology described in Criterion 6 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). The results indicated that the acreage of nonviable remnant parcels on farmable land would total approximately 1 percent of the acreage of the original parcels within the project footprint of this alternative. This criterion received a score of 0.
7. **Does the site have available adequate supply of farm support services and markets?** The regional consultant used the same methodology described in Criterion 7 for Alternative 1. This alternative would have a limited effect on farm services. This criterion received a score of 3.
8. **Does this site have substantial and well-maintained on-farm investments such as barns, fruit trees and vines, field terraces, drainage, irrigation, waterways, and other soil and water conservation measures?** The regional consultant used the same methods described in Criterion 8 for Alternative 1. The overall amount of on-farm investment is moderate. Ancillary agricultural structures, barns, fruit trees, irrigation lines, and drainage ditches were observed on the farms. Soil and water conservation measures have been applied to some of the fields. This criterion received a score of 16.
9. **Would this project, by converting the land to nonagricultural use, reduce the support for farm support services in the area?** The regional consultant used the same methodology described in Criterion 9 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). Considering there are approximately 420,154 acres of Important Farmland and Grazing Land in Santa Clara County (DOC 2016), the permanent conversion of 644 acres of Important Farmland and Grazing Land in Santa Clara County under Alternative 3, or less than 0.2 percent of the total Important Farmland in the County, is unlikely to would result in reduction in demand for farm support services in the area. This criterion received a score of 0.
10. **Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of the surrounding farmland to nonagricultural use?** The project would include construction of the San Jose Diridon Station and a second station in either downtown Gilroy or east Gilroy, depending on the alternative selected. The San Jose Diridon Station would be constructed at the existing Caltrain station site. For Alternative 3, the East Gilroy Station would be located on prime agricultural land. Stations have the potential to induce population growth and farmland conversion in the long run. The construction of the East Gilroy Station could induce growth in Gilroy because the station would improve the commuting options and the cost of living could draw people out of the larger, more expensive cities.

    There are also two locations under consideration for a MOWF: one is in east Gilroy and the other is in south Gilroy. For Alternative 3, east Gilroy would be the proposed location. While this site is located in an agricultural area, the maintenance facility would be used primarily for storage of rail vehicles and therefore not induce growth or lead to the eventual conversion of farmland. In addition, one MOIS facility is proposed in Merced County west of Turner Island Road.

    Alternative 3 would involve the construction of new track, TPSSs, and ATC sites. HSR track and electrical infrastructure does not have the same potential to induce growth as stations. Therefore, guideway and power or communication facilities would be largely compatible with adjacent agriculture and would not induce urban development.

    For these reasons, it is possible that Alternative 3 would lead to eventual conversion of surrounding farmland but it would remain sufficiently compatible with existing agriculture uses. This criterion received a score of 7.

Additional Notes

Alternative 3 is the shortest alternative at 87 miles long, with 52 miles in Santa Clara County.

Alternative 4

A. **Total acres to be converted directly?** The regional consultant used the same methodology described in Question A for Alternative 1. The results indicate that a total of 302 acres would be permanently converted.

B. **Total acres to be converted indirectly or to receive services?** The regional consultant used the same methodology described in Question B for Alternative 1. The results indicate that a total of 60 acres would be indirectly converted.

C. **Total acres in corridor?** The regional consultant used the same methodology described in Question C for Alternative 1. The results indicate that a total of 362 acres would be directly and indirectly permanently converted.

1. **How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?** The regional consultant used the same methodology described in Criterion 1 for Alternative 1. The results indicated that 65 percent of the total acreage within the buffer was nonurban use. This criterion received a score of 9.

2. **How much of the perimeter of the site borders on land in nonurban use?** The regional consultant used same methodology described in Criterion 2 for Alternative 1. The results indicated that 64 percent of the perimeter of the alternative borders on land in nonurban use. This criterion received a score of 7.

3. **How much of the site has been farmed more than 5 of the last 10 years?** According to satellite imagery analysis of the project footprint for the years between 2005 and 2015 as well as information from the Santa Clara County Agricultural Commissioner (Deviney pers. comm.), in general, some properties in the vicinity of this alternative have been consistently farmed for 10 or more years. This criterion received a score of 2.

4. **Is the site subject to state or local government policies or programs to protect farmland or covered by private programs to protect farmland?** The regional consultant used the same methodology described in Criterion 4 for Alternative 1. There are 741 acres of farmlands protected by private programs such as the Williamson Act and agricultural conservation easements. The results indicated that 8 percent of the land within the project footprint in Santa Clara County is Protected Farmland. This criterion received a score of 20.

5. **Are the farm units containing the site as large as the average-size farming unit in the county?** The regional consultant used the same methodology described in Criterion 5 for Alternative 1. Alternative 4 traverses farm units that are an average of 34 acres, or approximately 15 percent of the size of the average farm unit in the county. This criterion received a score of 0.

6. **How much of the remaining land on the farm will become nonfarmable if this site is selected?** The regional consultant used the same methodology described in Criterion 6 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). The results indicated that the acreage of nonviable remnant parcels on farmable land would total less than 1 percent of the acreage of the original parcels within the project footprint of this alternative. This criterion received a score of 0.

7. **Does the site have available adequate supply of farm support services and markets?** The regional consultant used the same methodology described in Criterion 7 for Alternative 1. This alternative would have a limited effect on farm services. This criterion received a score of 3.

8. **Does this site have substantial and well-maintained on-farm investments such as barns, fruit trees and vines, field terraces, drainage, irrigation, waterways, and other soil and water conservation measures?** The regional consultant used the same methods

described in Criterion 8 for Alternative 1. The overall amount of on-farm investment is low. This criterion received a score of 2.

9. **Would this project, by converting the land to nonagricultural use, reduce the support for farm support services in the area?** The regional consultant used the same methodology described in Criterion 9 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). Considering there are approximately 420,154 acres of Important Farmland and Grazing Land in Santa Clara County (DOC 2016), the permanent conversion of 362 acres of Important Farmland and Grazing Land in Santa Clara County under Alternative 4, or less than 0.1 percent of the total Important Farmland in the County, is unlikely to result in reduction in demand for farm support services in the area. This criterion received a score of 0.

10. **Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of the surrounding farmland to nonagricultural use?** The project would include construction of the San Jose Diridon Station and a second station in either downtown Gilroy or east Gilroy, depending on the alternative selected. For Alternative 4, neither of the proposed stations would be located on prime agricultural land. The San Jose Diridon Station would be constructed at the existing Caltrain station site, and the Downtown Gilroy Station would be built in an urban area. However, stations have the potential to induce population growth and farmland conversion in the long run. The construction of the Downtown Gilroy Station could induce growth in Gilroy because the station would improve the commuting options and the cost of living could draw people out of the larger, more expensive cities.

    There are also two locations under consideration for a MOWF: one is in east Gilroy and the other is in south Gilroy. For Alternative 2, south Gilroy would be the proposed location. While this site is located in an agricultural area, the maintenance facility would be used primarily for storage of rail vehicles and therefore not induce growth or lead to the eventual conversion of farmland. In addition, one MOIS facility is proposed in Merced County west of Turner Island Road.

    Alternative 2 would involve the construction of new track, TPSSs, and ATC sites. HSR track and electrical infrastructure does not have the same potential to induce growth as stations. Therefore, guideway and power or communication facilities would be largely compatible with adjacent agriculture and would not induce urban development.

    For these reasons, it is possible that Alternative 2 would lead to eventual conversion of surrounding farmland but it would remain sufficiently compatible with existing agriculture uses. This criterion received a score of 5.

Additional Notes

Alternative 4 is tied with Alternatives 1 and 2 for the longest length at approximately 89 miles, with 52 miles in Santa Clara County.

(Rev. 1-91)

FARMLAND CONVERSION IMPACT RATING FOR CORRIDOR TYPE PROJECTS

PART I *(To be completed by Federal Agency)*	3. Date of Land Evaluation Request	4. Sheet 1 of _____
1. Name of Project	5. Federal Agency Involved	
2. Type of Project	6. County and State	

PART II *(To be completed by NRCS)*	1. Date Request Received by NRCS	2. Person Completing Form
3. Does the corridor contain prime, unique statewide or local important farmland? (If no, the FPPA does not apply - Do not complete additional parts of this form). YES ☐ NO ☐		4. Acres Irrigated | Average Farm Size
5. Major Crop(s)	6. Farmable Land in Government Jurisdiction **Acres:** **%**	7. Amount of Farmland As Defined in FPPA **Acres:** **%**
8. Name Of Land Evaluation System Used	9. Name of Local Site Assessment System	10. Date Land Evaluation Returned by NRCS

PART III *(To be completed by Federal Agency)*	**Alternative Corridor For Segment _____**			
	Corridor A	**Corridor B**	**Corridor C**	**Corridor D**
A. Total Acres To Be Converted Directly				
B. Total Acres To Be Converted Indirectly, Or To Receive Services				
C. Total Acres In Corridor				
PART IV *(To be completed by NRCS) Land Evaluation Information*				
A. Total Acres Prime And Unique Farmland				
B. Total Acres Statewide And Local Important Farmland				
C. Percentage Of Farmland in County Or Local Govt. Unit To Be Converted				
D. Percentage Of Farmland in Govt. Jurisdiction With Same Or Higher Relative Value				
PART V *(To be completed by NRCS) Land Evaluation Information Criterion Relative value of Farmland to Be Serviced or Converted (Scale of 0 - 100 Points)*				
PART VI *(To be completed by Federal Agency) Corridor Assessment Criteria (These criteria are explained in 7 CFR 658.5(c))* — **Maximum Points**				
1. Area in Nonurban Use — **15**				
2. Perimeter in Nonurban Use — **10**				
3. Percent Of Corridor Being Farmed — **20**				
4. Protection Provided By State And Local Government — **20**				
5. Size of Present Farm Unit Compared To Average — **10**				
6. Creation Of Nonfarmable Farmland — **25**				
7. Availablility Of Farm Support Services — **5**				
8. On-Farm Investments — **20**				
9. Effects Of Conversion On Farm Support Services — **25**				
10. Compatibility With Existing Agricultural Use — **10**				
TOTAL CORRIDOR ASSESSMENT POINTS — **160**	0	0	0	0
PART VII *(To be completed by Federal Agency)*				
Relative Value Of Farmland (From Part V) — **100**	0	0	0	0
Total Corridor Assessment (From Part VI above or a local site assessment) — **160**	0	0	0	0
TOTAL POINTS *(Total of above 2 lines)* — **260**	0	0	0	0

1. Corridor Selected:	2. Total Acres of Farmlands to be Converted by Project:	3. Date Of Selection:	4. Was A Local Site Assessment Used? YES ☐ NO ☐

5. Reason For Selection:

Signature of Person Completing this Part: Diana P. Robas | DATE

NOTE: Complete a form for each segment with more than one Alternate Corridor

Clear Form

CORRIDOR - TYPE SITE ASSESSMENT CRITERIA

The following criteria are to be used for projects that have a linear or corridor - type site configuration connecting two distant points, and crossing several different tracts of land. These include utility lines, highways, railroads, stream improvements, and flood control systems. Federal agencies are to assess the suitability of each corridor - type site or design alternative for protection as farmland along with the land evaluation information.

(1) How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?
More than 90 percent - 15 points
90 to 20 percent - 14 to 1 point(s)
Less than 20 percent - 0 points

(2) How much of the perimeter of the site borders on land in nonurban use?
More than 90 percent - 10 points
90 to 20 percent - 9 to 1 point(s)
Less than 20 percent - 0 points

(3) How much of the site has been farmed (managed for a scheduled harvest or timber activity) more than five of the last 10 years?
More than 90 percent - 20 points
90 to 20 percent - 19 to 1 point(s)
Less than 20 percent - 0 points

(4) Is the site subject to state or unit of local government policies or programs to protect farmland or covered by private programs to protect farmland?
Site is protected - 20 points
Site is not protected - 0 points

(5) Is the farm unit(s) containing the site (before the project) as large as the average - size farming unit in the County ? (Average farm sizes in each county are available from the NRCS field offices in each state. Data are from the latest available Census of Agriculture, Acreage or Farm Units in Operation with $1,000 or more in sales.)
As large or larger - 10 points
Below average - deduct 1 point for each 5 percent below the average, down to 0 points if 50 percent or more below average - 9 to 0 points

(6) If the site is chosen for the project, how much of the remaining land on the farm will become non-farmable because of interference with land patterns?
Acreage equal to more than 25 percent of acres directly converted by the project - 25 points
Acreage equal to between 25 and 5 percent of the acres directly converted by the project - 1 to 24 point(s)
Acreage equal to less than 5 percent of the acres directly converted by the project - 0 points

(7) Does the site have available adequate supply of farm support services and markets, i.e., farm suppliers, equipment dealers, processing and storage facilities and farmer's markets?
All required services are available - 5 points
Some required services are available - 4 to 1 point(s)
No required services are available - 0 points

(8) Does the site have substantial and well-maintained on-farm investments such as barns, other storage building, fruit trees and vines, field terraces, drainage, irrigation, waterways, or other soil and water conservation measures?
High amount of on-farm investment - 20 points
Moderate amount of on-farm investment - 19 to 1 point(s)
No on-farm investment - 0 points

(9) Would the project at this site, by converting farmland to nonagricultural use, reduce the demand for farm support services so as to jeopardize the continued existence of these support services and thus, the viability of the farms remaining in the area?
Substantial reduction in demand for support services if the site is converted - 25 points
Some reduction in demand for support services if the site is converted - 1 to 24 point(s)
No significant reduction in demand for support services if the site is converted - 0 points

(10) Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of surrounding farmland to nonagricultural use?
Proposed project is incompatible to existing agricultural use of surrounding farmland - 10 points
Proposed project is tolerable to existing agricultural use of surrounding farmland - 9 to 1 point(s)
Proposed project is fully compatible with existing agricultural use of surrounding farmland - 0 points

APPENDIX 3.14-B, ATTACHMENT 2:
Natural Resources Conservation Service Land Evaluation Explanations and Calculations for San Benito County

APPENDIX 3.14-B, ATTACHMENT 2: NATURAL RESOURCES CONSERVATION SERVICE LAND EVALUATION EXPLANATIONS AND CALCULATIONS—SAN BENITO COUNTY

INTRODUCTION

This attachment provides an explanation for corridor assessment points assigned to the proposed San Jose to Central Valley Wye Project Extent (project) in part VI of the NRCS-CPA-106 form prepared for San Benito County. The scores indicated in the questions pertain to the portion of each project alternative that falls within San Benito County.

Explanations

Alternative 1

A. **Total acres to be converted directly?** The regional consultant overlaid the alternative on a map of the Farmland Mapping and Monitoring Program (FMMP) categories to determine how many acres of Important Farmland would be permanently converted by Alternative 1. The results indicate that a total of 104 acres would be directly permanently converted.

B. **Total acres to be converted indirectly or to receive services?** To determine the acreage of indirect impact, particularly the acreage of remnant and severed parcels created by the alternative, the regional consultant identified remnant parcels of Important Farmland that would be less than 20 acres. The regional consultant then reviewed each remnant to determine whether it would be viable or nonviable for continued agriculture (i.e., identified those remnants with shape, size, location, or hardship that would make them nonviable for continued agricultural use) (ARWS 2018a, 2018b, 2018c, 2018d). The results indicate that a total of 0.1 acres would be permanently indirectly converted as remnant or severed parcels.

C. **Total acres in corridor?** The regional consultant added the total acreage to be directly converted with the total acreage to be indirectly converted. The result indicates that a total of 104 acres would be directly and indirectly permanently converted.

1. **How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?** The regional consultant generated a buffer of 1 mile around Alternative 1 in San Benito County, including the temporary construction easement, to determine the total acreage of land within a 1-mile radius of the alternative in San Benito County. The buffer was overlaid on a map of the FMMP categories, which include Urban and Built-Up Land. For this analysis, Urban and Built-Up Land is considered urban use (DOC 2014a). Then, the acreage within the buffer that is classified as Urban and Built-Up Land was calculated using a geographic information system (GIS), and the remaining acreage was considered nonurban use. The results indicated that 99 percent of the total acreage within the buffer was nonurban use. This criterion received a score of 15.

2. **How much of the perimeter of the site borders on land in nonurban use?** The length of the perimeter of Alternative 1 in San Benito County, including the temporary construction easement, was measured by the regional consultant to determine the total length of the perimeter in San Benito County. The regional consultant then calculated the proportion of the alternative perimeter that borders on land classified as Urban and Built-Up Land, and the remaining proportion of the perimeter was considered to border nonurban use. The results indicated that 100 percent of the alternative perimeter borders on land in nonurban use. This criterion received a score of 10.

3. **How much of the site has been farmed more than 5 of the last 10 years?** According to satellite imagery analysis of Alternative 1 in San Benito County for the years between 2005 and 2015 as well as information from the San Benito County Agricultural Commissioner (Overstreet pers. comm.), in general, many properties in the vicinity of this alternative have been consistently farmed for 10 or more years. This criterion received a score of 19.

4. **Is the site subject to state or local government policies or programs to protect farmland or covered by private programs to protect farmland?** The area for Alternative 1, including remnant parcels that would likely not be suitable for farming after the project is completed, was overlaid on a map of Protected Farmland (DOC 2014b), defined as lands enrolled in Williamson Act or Farmland Security Zone contracts by the regional consultant. There are 115 acres of farmlands protected by private programs such as the Williamson Act and agricultural conservation easements. The results indicated that 8 percent of the land within the project footprint in San Benito County is Protected Farmland. This criterion received a score of 20.

5. **Are the farm units containing the site as large as the average-size farming unit in the county?** The average size farm in San Benito County was 962 acres in 2012 (USDA 2012), the most recent year for which average farm size data are available. Alternative 1 traverses farm units that are an average of 177 acres, or approximately 18 percent of the size of the average farm unit in the county. This criterion received a score of 0.

6. **How much of the remaining land on the farm will become nonfarmable if this site is selected?** In some areas the alignment of Alternative 1 deviates from transportation corridors and bisects or otherwise severs agricultural parcels. Some of the remnant parcels resulting from this severance may not be viable for continued agricultural use. The regional consultant team used GIS software to identify parcels of Important Farmland that would be 20 acres or less following severance due to construction of the project. It was assumed that parcels greater than 20 acres would be viable for continued agricultural use. Analysts then evaluated the characteristics of each of the remnant parcels of 20 acres or less using criteria described in Appendix C, Remnant Parcel Analysis, to determine which parcels would be viable for continued agricultural use and which parcels would likely result in conversion to nonagricultural use. The acreage of the remnant parcels determined not viable for continued agricultural use was compared to the acreage of the original parcels (ARWS 2018a, 2018b, 2018c, 2018d). The results indicated that the acreage of nonviable remnant parcels on farmable land would total less than 1 percent of the acreage of the original parcels within the project footprint of this alternative. This criterion received a score of 0.

7. **Does the site have available adequate supply of farm support services and markets?** According to the San Benito County Agricultural Commissioner (Overstreet pers. comm.), the area in the vicinity of Alternative 1 has been farmed for 50 to 100 years and it has adequate support services and markets. This alternative would not have an effect on farm services. This criterion received a score of 5.

8. **Does this site have substantial and well-maintained on-farm investments such as barns, fruit trees and vines, field terraces, drainage, irrigation, waterways, and other soil and water conservation measures?** According to satellite imagery analysis of the area around Alternative 1 performed by the regional consultant, the overall amount of on-farm investment is moderate. Ancillary agricultural structures, barns, fruit trees, irrigation lines, waterways, and drainage ditches were observed on the farms. Soil and water conservation measures have been applied to some of the fields. This criterion received a score of 6.

9. **Would this project, by converting the land to nonagricultural use, reduce the support for farm support services in the area?** The regional consultant overlaid the alternative on a map of the FMMP categories to determine how many acres of Important Farmland would be permanently converted by Alternative 1, plus acreage of nonviable remnant parcels less than 20 acres (i.e., those that have shape, size, location, or hardship that would make them nonviable for continued agricultural use) (ARWS 2018a, 2018b, 2018c, 2018d). Considering there are approximately 671,685 acres of Important Farmland and Grazing Land in San Benito County (DOC 2016), the permanent conversion of 104 acres of Important Farmland and Grazing in San Benito County under Alternative 1, or less than 0.1 percent of the total Important Farmland in the County, is unlikely to result in reduction in demand for farm support services in the area. This criterion received a score of 0.

10. **Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of the surrounding farmland to nonagricultural use?** The project would include construction of the San Jose Diridon Station and a second station in either downtown Gilroy or east Gilroy, depending on the alternative selected. For Alternative 1, the Gilroy station would be located downtown. Stations have the potential to induce population growth and farmland conversion. While there are no proposed stations in San Benito County, the proximity of the proposed could result in population growth and the eventual conversion of surrounding agricultural land.

    There are two locations under consideration for a maintenance of way facility (MOWF) but both are in Gilroy, in Santa Clara County, not in San Benito County. In addition, one maintenance of infrastructure siding facility (MOIS) is proposed in Merced County west of Turner Island Road.

    Alternative 1 would involve the construction of new track, traction power substations (TPSS), and automated train control (ATC) sites. In contrast to stations, which could induce population growth and farmland conversion, guideway use and power or electrical facilities would be largely compatible with adjacent agriculture and would not induce urban development. Therefore, it is unlikely that guideway use would contribute to eventual conversion of surrounding farmland to nonagricultural use. This criterion received a score of 2.

Additional Notes

Alternative 1 is tied with Alternatives 2 and 4 for the longest length at approximately 89 miles, with 5 miles in San Benito County.

Alternative 2

A. **Total acres to be converted directly?** The regional consultant used the same methodology described in Question A for Alternative 1. The results indicate that a total of 104 acres would be directly permanently converted.

B. **Total acres to be converted indirectly or to receive services?** The regional consultant used the same methodology described in Question B for Alternative 1. The results indicate that a total of 0.1 acres would be indirectly converted.

C. **Total acres in corridor?** The regional consultant used the same methodology described in Question C for Alternative 1. The results indicate that a total of 104 acres would be directly and indirectly permanently converted.

1. **How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?** The regional consultant used the same methodology described in Criterion 1 for Alternative 1. The results indicated that 99 percent of the total acreage within the buffer was nonurban use. This criterion received a score of 15.

2. **How much of the perimeter of the site borders on land in nonurban use?** The regional consultant used same methodology described in Criterion 2 for Alternative 1. The results indicated that 100 percent of the perimeter of the alternative borders on land in nonurban use. This criterion received a score of 10.

3. **How much of the site has been farmed more than 5 of the last 10 years?** According to satellite imagery analysis of the project footprint for the years between 2005 and 2015 as well as information from the San Benito County Agricultural Commissioner (Overstreet pers. comm.), in general, many properties in the vicinity of this alternative have been consistently farmed for 10 or more years. This criterion received a score of 19.

4. **Is the site subject to state or local government policies or programs to protect farmland or covered by private programs to protect farmland?** The regional consultant used the same methodology described in Criterion 4 for Alternative 1. There are 115 acres of farmlands protected by private programs such as the Williamson Act and agricultural

conservation easements . The results indicated that 8 percent of the land within the project footprint in San Benito County is Protected Farmland. This criterion received a score of 20.

5. **Are the farm units containing the site as large as the average-size farming unit in the county?** The regional consultant used the same methodology described in Criterion 5 for Alternative 1. Alternative 2 traverses farm units that are an average of 177 acres, or approximately 18 percent of the size of the average farm unit in the county. This criterion received a score of 0.

6. **How much of the remaining land on the farm will become nonfarmable if this site is selected?** The regional consultant used the same methodology described in Criterion 6 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). The results indicated that the acreage of nonviable remnant parcels on farmable land would total less than 1 percent of the acreage of the original parcels that would be within the project footprint of this alternative. This criterion received a score of 0.

7. **Does the site have available adequate supply of farm support services and markets?** The regional consultant used the same methodology described in Criterion 7 for Alternative 1. This alternative would not have an effect on farm services. This criterion received a score of 5.

8. **Does this site have substantial and well-maintained on-farm investments such as barns, fruit trees and vines, field terraces, drainage, irrigation, waterways, and other soil and water conservation measures?** The regional consultant used the same methods described in Criterion 8 for Alternative 1. The overall amount of on-farm investment is moderate. Ancillary agricultural structures, barns, fruit trees, irrigation lines, waterways, and drainage ditches were observed on the farms. Soil and water conservation measures have been applied to some of the fields. This criterion received a score of 7.

9. **Would this project, by converting the land to nonagricultural use, reduce the support for farm support services in the area?** The regional consultant used the same methodology described in Criterion 9 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). Considering there are approximately 671,685 acres of Important Farmland and Grazing Land in San Benito County (DOC 2016), the permanent conversion of 104 acres of Important Farmland and Grazing Land in San Benito County under Alternative 2, or less than 0.1 percent of the total Important Farmland in the County, is unlikely to result in reduction in demand for farm support services in the area. This criterion received a score of 0.

10. Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of the surrounding farmland to nonagricultural use? The project would include construction of the San Jose Diridon Station and a second station in either downtown Gilroy or east Gilroy, depending on the alternative selected. For Alternative 2, the Gilroy station would be located downtown. Stations have the potential to induce population growth and farmland conversion. While there are no proposed stations in San Benito County, the proximity of the proposed Downtown Gilroy Station could result in population growth and the eventual conversion of surrounding agricultural land.

    There are two locations under consideration for a MOWF but both are in Gilroy, not San Benito County. In addition, one MOIS facility is proposed in Merced County west of Turner Island Road.

    Alternative 2 would involve the construction of new track, TPSSs, and ATC sites. In contrast to stations, which could induce population growth and farmland conversion, guideway use and power or electrical facilities are largely compatible with adjacent agriculture and would not induce urban development.

    Therefore, it is unlikely that guideway use would contribute to eventual conversion of surrounding farmland to nonagricultural use. This criterion received a score of 2.

Additional Notes

Alternative 2 is tied with Alternatives 1 and 4 for the longest length at approximately 89 miles, with 5 miles in San Benito County.

Alternative 3

A. **Total acres to be converted directly?** The regional consultant used the same methodology described in Question A for Alternative 1. The results indicate that a total of 100 acres would be directly permanently converted.

B. **Total acres to be converted indirectly or to receive services?** The regional consultant used the same methodology described in Question B for Alternative 1. The results indicate that a total of 2 acres would be indirectly converted.

C. **Total acres in corridor?** The regional consultant used the same methodology described in Question C for Alternative 1. The results indicate that a total of 102 acres would be directly and indirectly permanently converted.

1. **How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?** The regional consultant used the same methodology described in Criterion 1 for Alternative 1. The results indicated that over 99 percent of the total acreage within the buffer was nonurban use. This criterion received a score of 15.

2. **How much of the perimeter of the site borders on land in nonurban use?** The regional consultant used same methodology described in Criterion 2 for Alternative 1. The results indicated that 100 percent of the perimeter of the alternative borders on land in nonurban use. This criterion received a score of 10.

3. **How much of the site has been farmed more than 5 of the last 10 years** According to satellite imagery analysis of the project footprint for the years between 2005 and 2015 as well as information from the San Benito County Agricultural Commissioner (Overstreet pers. comm.), in general, many properties in the vicinity of this alternative have been consistently farmed for 10 or more years. This criterion received a score of 17.

4. **Is the site subject to state or local government policies or programs to protect farmland or covered by private programs to protect farmland?** The regional consultant used the same methodology described in Criterion 4 for Alternative 1. There are 130 acres of farmlands protected by private programs such as the Williamson Act and agricultural conservation easements. The results indicated that 8 percent of the land within the project footprint in San Benito County is Protected Farmland. This criterion received a score of 20.

5. **Are the farm units containing the site as large as the average-size farming unit in the county?** The regional consultant used the same methodology described in Criterion 5 for Alternative 1. Alternative 3 traverses farm units that are an average of 184 acres, or approximately 19 percent of the size of the average farm unit. This criterion received a score of 0.

6. **How much of the remaining land on the farm will become nonfarmable if this site is selected?** The regional consultant used the same methodology described in Criterion 6 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). The results indicated that the acreage of nonviable remnant parcels on farmable land would total less than 1 percent of the acreage of the original parcels within the project footprint of this alternative. This criterion received a score of 0.

7. **Does the site have available adequate supply of farm support services and markets?** The regional consultant used the same methodology described in Criterion 7 for Alternative 1. This alternative would not have an effect on farm services. This criterion received a score of 5.

8. **Does this site have substantial and well-maintained on-farm investments such as barns, fruit trees and vines, field terraces, drainage, irrigation, waterways, and other**

soil and water conservation measures? The regional consultant used the same methods described in Criterion 8 for Alternative 1. The overall amount of on-farm investment is moderate. Ancillary agricultural structures, barns, fruit trees, irrigation lines, waterways, and drainage ditches were observed on the farms. Soil and water conservation measures have been applied to some of the fields. This criterion received a score of 6.

9. **Would this project, by converting the land to nonagricultural use, reduce the support for farm support services in the area?** The regional consultant used the same methodology described in Criterion 9 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). Considering there are approximately 671,685 acres of Important Farmland and Grazing Land in San Benito County (DOC 2016), the permanent conversion of 102 acres of Important Farmland and Grazing Land in San Benito County under Alternative 3, or less than 0.1 percent of the total Important Farmland in the County, is unlikely to result in reduction in demand for farm support services in the area. This criterion received a score of 0.

10. **Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of the surrounding farmland to nonagricultural use?** The project would include construction of the San Jose Diridon Station and a second station in either downtown Gilroy or east Gilroy, depending on the alternative selected. For Alternative 3, the station location would be on prime agricultural land in east Gilroy. Stations have the potential to induce population growth and farmland conversion. While there are no proposed stations in San Benito County, the proximity of the East Gilroy Station could result in population growth and the eventual conversion of surrounding agricultural land.

    There are two locations under consideration for a MOWF but both are in Gilroy, not San Benito County. In addition, one MOIS facility is proposed in Merced County west of Turner Island Road.

    Alternative 3 would involve the construction of new track, TPSSs, and ATC sites. In contrast to stations, which could induce population growth and farmland conversion, guideway use and power or electrical facilities are largely compatible with adjacent agriculture and would not induce urban development. Therefore, it is unlikely that guideway use would contribute to eventual conversion of surrounding farmland to nonagricultural use. This criterion received a score of 2.

Additional Notes

Alternative 3 is the shortest alternative at 87 miles long, with 4 miles in San Benito County.

Alternative 4

A. **Total acres to be converted directly?** The regional consultant used the same methodology described in Question A for Alternative 1. The results indicate that a total of 107 acres would be directly permanently converted.

B. **Total acres to be converted indirectly or to receive services?** The regional consultant used the same methodology described in Question B for Alternative 1. The results indicate that a total of 0.2 acres would be indirectly converted.

C. **Total acres in corridor?** The regional consultant used the same methodology described in Question C for Alternative 1. The results indicate that a total of 107 acres would be directly and indirectly permanently converted.

1. **How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?** The regional consultant used the same methodology described in Criterion 1 for Alternative 1. The results indicated that 99 percent of the total acreage within the buffer was non urban use. The criterion received a score of 15.

2. **How much of the perimeter of the site borders on land in nonurban use?** The regional consultant used same methodology described in Criterion 2 for alternative 1. The results

indicated that 100 percent of the perimeter of the alternative borders on land in nonurban use. This criterion received a score of 10.

3. **How much of the site has been farmed more than 5 of the last 10 years?** Accorrdin to satellite imagery analysis of the project footprint for the years between 2005 and 2015 as well as information from the San Benito County Agricultural Commissioner (Overstreet pers.comm.), in general, many properties in the vicinity of this alternative have been consistenyly farmed for 10 or more years. This criterion received a scrore of 19.
4. **Is the site subject to state or local government policies or programs to protect farmland or covered by private programs to protect farmland?** The regional consultant used the same methodology described in Criterion 4 for alternative 1. There are 118 acres of farmlands protected by private programs such as the Williamson Act and agricultural conservation easements. The results indicated that 8 percent of the land within the project footprint in San Benito County is Protected Farmland. This criterion received a score of 20.
5. **Are the farm units containing the site as large as the average-size farming unit in the county?** The regional consultant used the same methodology described in Criterion 5 or Alternative 1. Alternative 2 traverses farm units that are an average of 61.8 acres,or approximately 177 acres, or approximately 18 percent of the average farm unit in the county. This criterion received a score of 0.
6. **How much of the remaining land on the farm will become nonfarmable if this site is selected?** The regional consultant used the same methodology described in Criterion 6 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). The results indicated that the acreage of nonviable remnant parcels on farmable land would total less than 1 percent of the acreage of the original parcels that would be within the project footprint of this alternative. This criterion received a score of 0.
7. **Does the site have available adequate supply of farm support services and markets?** The regional consultant used the same methodology described in Criterion 7 for Alternative1. This alternative would not have an effect on farm services. This criterion received a score of 5.
8. **Does this site have substantial and well-maintained on-farm investments such as barns, fruit trees and vines, field terraces, drainage, irrigation, waterways, and other soil and water conservation measures?** The regional consultant used the same methods described in Criterion 8 for Alternative 1. The overall amount of on-farm investment is moderate. Ancillary agricultural structures, barns, fruit trees, irrigation lines, waterways, and drainage ditches were observed on the farms. Soil and water conservation measures have been applied to some of the fields. This criterion received a score of 6.
9. **Would this project, by converting the land to nonagricultural use, reduce the support for farm support services in the area?** The regional consultant used the same methodology described in Criterion 9 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). Considering there are approximatelt 671,685 acres of Important Farmland and Grazing Land in San Benito County (DOC 2016), the permanent conversion of 107 acres of Important Farmland and Grazing Land in San Benito County under Alternative 4, or less than 0.1 percent of the total Important Farmland in the County, is unlikely to result in reduction in demand for farm support services in the area. This criterion received a score of 0.
10. Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of the surrounding farmland to nonagricultural use? The project would include construction of the San Jose Diridon Station and a second station in either downtown Gilroy or east Gilroy, depending on the alternative selected. For Alternative 4, the Gilroy station would be located downtown. Stations have the potential to induce population growth and farmland conversion. While there are no proposed stations in San Benito County, the proximity of the proposed Downtown Gilroy Station could result in population growth and the eventual conversion of surrounding agricultural land.

There are also two locations under consideration for a MOWF but both are in Gilroy, not San Benito County. In addition, one MOIS facility is proposed in Merced County west of Turner Island Road.

Alternative 4 would involve the construction of new track, TPSSs, and ATC sites. In contrast to stations, which could induce population growth and farmland conversion, guideway use and power or electrical facilities are largely compatible with adjacent agriculture and would not induce urban development.

Therefore, it is unlikely that guideway use would contribute to eventual conversion of surrounding farmland to nonagricultural use. This criterion received a score of 2.

Additional Notes

Alternative 4 is tied with Alternatives 1 and 2 for the longest length at approximately 89 miles, with 5 miles in San Benito County.

NRCS-CPA-106
(Rev. 1-91)

FARMLAND CONVERSION IMPACT RATING FOR CORRIDOR TYPE PROJECTS

PART I *(To be completed by Federal Agency)*	3. Date of Land Evaluation Request	4. Sheet 1 of _____
1. Name of Project	5. Federal Agency Involved	
2. Type of Project	6. County and State	

PART II *(To be completed by NRCS)*	1. Date Request Received by NRCS	2. Person Completing Form
3. Does the corridor contain prime, unique statewide or local important farmland? (If no, the FPPA does not apply - Do not complete additional parts of this form). YES ☐ NO ☐		4. Acres Irrigated | Average Farm Size
5. Major Crop(s)	6. Farmable Land in Government Jurisdiction **Acres:** **%**	7. Amount of Farmland As Defined in FPPA **Acres:** **%**
8. Name Of Land Evaluation System Used	9. Name of Local Site Assessment System	10. Date Land Evaluation Returned by NRCS

PART III *(To be completed by Federal Agency)*	**Alternative Corridor For Segment _____**			
	Corridor A	**Corridor B**	**Corridor C**	**Corridor D**
A. Total Acres To Be Converted Directly				
B. Total Acres To Be Converted Indirectly, Or To Receive Services				
C. Total Acres In Corridor				
PART IV *(To be completed by NRCS) Land Evaluation Information*				
A. Total Acres Prime And Unique Farmland				
B. Total Acres Statewide And Local Important Farmland				
C. Percentage Of Farmland in County Or Local Govt. Unit To Be Converted				
D. Percentage Of Farmland in Govt. Jurisdiction With Same Or Higher Relative Value				
PART V *(To be completed by NRCS) Land Evaluation Information Criterion Relative value of Farmland to Be Serviced or Converted (Scale of 0 - 100 Points)*				
PART VI *(To be completed by Federal Agency) Corridor Assessment Criteria (These criteria are explained in 7 CFR 658.5(c))* — **Maximum Points**				
1. Area in Nonurban Use — **15**				
2. Perimeter in Nonurban Use — **10**				
3. Percent Of Corridor Being Farmed — **20**				
4. Protection Provided By State And Local Government — **20**				
5. Size of Present Farm Unit Compared To Average — **10**				
6. Creation Of Nonfarmable Farmland — **25**				
7. Availablility Of Farm Support Services — **5**				
8. On-Farm Investments — **20**				
9. Effects Of Conversion On Farm Support Services — **25**				
10. Compatibility With Existing Agricultural Use — **10**				
TOTAL CORRIDOR ASSESSMENT POINTS — **160**	0	0	0	0
PART VII *(To be completed by Federal Agency)*				
Relative Value Of Farmland (From Part V) — **100**	0	0	0	0
Total Corridor Assessment (From Part VI above or a local site assessment) — **160**	0	0	0	0
TOTAL POINTS *(Total of above 2 lines)* — **260**	0	0	0	0

1. Corridor Selected:	2. Total Acres of Farmlands to be Converted by Project:	3. Date Of Selection:	4. Was A Local Site Assessment Used? YES ☐ NO ☐

5. Reason For Selection:

Signature of Person Completing this Part: Diana P. Robas | DATE

NOTE: Complete a form for each segment with more than one Alternate Corridor

Clear Form

CORRIDOR - TYPE SITE ASSESSMENT CRITERIA

The following criteria are to be used for projects that have a linear or corridor - type site configuration connecting two distant points, and crossing several different tracts of land. These include utility lines, highways, railroads, stream improvements, and flood control systems. Federal agencies are to assess the suitability of each corridor - type site or design alternative for protection as farmland along with the land evaluation information.

(1) How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?
More than 90 percent - 15 points
90 to 20 percent - 14 to 1 point(s)
Less than 20 percent - 0 points

(2) How much of the perimeter of the site borders on land in nonurban use?
More than 90 percent - 10 points
90 to 20 percent - 9 to 1 point(s)
Less than 20 percent - 0 points

(3) How much of the site has been farmed (managed for a scheduled harvest or timber activity) more than five of the last 10 years?
More than 90 percent - 20 points
90 to 20 percent - 19 to 1 point(s)
Less than 20 percent - 0 points

(4) Is the site subject to state or unit of local government policies or programs to protect farmland or covered by private programs to protect farmland?
Site is protected - 20 points
Site is not protected - 0 points

(5) Is the farm unit(s) containing the site (before the project) as large as the average - size farming unit in the County ? (Average farm sizes in each county are available from the NRCS field offices in each state. Data are from the latest available Census of Agriculture, Acreage or Farm Units in Operation with $1,000 or more in sales.)
As large or larger - 10 points
Below average - deduct 1 point for each 5 percent below the average, down to 0 points if 50 percent or more below average - 9 to 0 points

(6) If the site is chosen for the project, how much of the remaining land on the farm will become non-farmable because of interference with land patterns?
Acreage equal to more than 25 percent of acres directly converted by the project - 25 points
Acreage equal to between 25 and 5 percent of the acres directly converted by the project - 1 to 24 point(s)
Acreage equal to less than 5 percent of the acres directly converted by the project - 0 points

(7) Does the site have available adequate supply of farm support services and markets, i.e., farm suppliers, equipment dealers, processing and storage facilities and farmer's markets?
All required services are available - 5 points
Some required services are available - 4 to 1 point(s)
No required services are available - 0 points

(8) Does the site have substantial and well-maintained on-farm investments such as barns, other storage building, fruit trees and vines, field terraces, drainage, irrigation, waterways, or other soil and water conservation measures?
High amount of on-farm investment - 20 points
Moderate amount of on-farm investment - 19 to 1 point(s)
No on-farm investment - 0 points

(9) Would the project at this site, by converting farmland to nonagricultural use, reduce the demand for farm support services so as to jeopardize the continued existence of these support services and thus, the viability of the farms remaining in the area?
Substantial reduction in demand for support services if the site is converted - 25 points
Some reduction in demand for support services if the site is converted - 1 to 24 point(s)
No significant reduction in demand for support services if the site is converted - 0 points

(10) Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of surrounding farmland to nonagricultural use?
Proposed project is incompatible to existing agricultural use of surrounding farmland - 10 points
Proposed project is tolerable to existing agricultural use of surrounding farmland - 9 to 1 point(s)
Proposed project is fully compatible with existing agricultural use of surrounding farmland - 0 points

APPENDIX 3.14-B, ATTACHMENT 3:
Natural Resources Conservation Service Land Evaluation Explanations and Calculations for Merced County

APPENDIX 3.14-B, ATTACHMENT 3: NATURAL RESOURCES CONSERVATION SERVICE LAND EVALUATION EXPLANATIONS AND CALCULATIONS—MERCED COUNTY

INTRODUCTION

This attachment provides an explanation for corridor assessment points assigned to the proposed San Jose to Central Valley Wye Project Extent (project) in part VI of the NRCS-CPA-106 form prepared for Merced County. All four alternative alignments are the same within Merced County. The scores indicated in the questions pertain to the portion of each project alternative that falls within Merced County.

Explanations

Alternative 1

A. **Total acres to be converted directly?** The regional consultant overlaid the alternative on a map of the Farmland Mapping and Monitoring Program (FMMP) categories to determine how many acres of Important Farmland would be permanently converted by Alternative 1. The results indicate that a total of 616 acres would be permanently converted, of which 79 acres are remnant parcels.

B. **Total acres to be converted indirectly or to receive services?** To determine the acreage of indirect impact, particularly the acreage of remnant and severed parcels created by the alternative, the regional consultant identified remnant parcels of Important Farmland that would be less than 20 acres. The regional consultant then reviewed each remnant to determine whether it would be viable or nonviable for continued agriculture (i.e., identified those remnants with shape, size, location, or hardship that would make them nonviable for continued agricultural use) (ARWS 2018a, 2018b, 2018c, 2018d). The results indicate that a total of 80 acres would be permanently indirectly converted as remnant or severed parcels.

C. **Total acres in corridor?** The regional consultant added the total acreage to be directly converted with the total acreage to be indirectly converted. The results indicate that a total of 696 acres would be directly and indirectly permanently converted.

1. **How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?** The regional consultant generated a buffer of 1 mile around Alternative 1 in Merced County, including the temporary construction easement, to determine the total acreage of land within a 1-mile radius of the alternative in Merced County. The buffer was overlaid on a map of the FMMP categories, which include Urban and Built-Up Land. For this analysis, Urban and Built-Up Land is considered urban use (DOC 2014a). Then, the acreage within the buffer that is classified as Urban and Built-Up Land was calculated using a geographic information system (GIS), and the remaining acreage was considered nonurban use. The results indicated that over 97 percent of the total acreage within the buffer was nonurban use. This criterion received a score of 15.

2. **How much of the perimeter of the site borders on land in nonurban use?** The length of the perimeter of Alternative 1 in Merced County, including the temporary construction easement, was measured by the regional consultant to determine the total length of the perimeter in Merced County. The regional consultant then calculated the proportion of the alternative perimeter that borders on land classified as Urban and Built-Up Land, and the remaining proportion of the perimeter was considered to border nonurban use. The results indicated that 97 percent of the alternative perimeter borders on land in nonurban use. This criterion received a score of 10.

3. **How much of the site has been farmed more than 5 of the last 10 years?** According to satellite imagery analysis of the area around Alternative 1 in Merced County for the years between 2005 and 2015, as well as information from the Merced County Agricultural Commissioner (Robinson pers. comm.), in general, some properties in the vicinity of this

alternative have been consistently farmed for 10 or more years. This criterion received a score of 11.

4. **Is the site subject to state or local government policies or programs to protect farmland or covered by private programs to protect farmland?** The area for Alternative 1 in Merced County, including remnant parcels that would likely not be suitable for farming after the project is completed, was overlaid on a map of Protected Farmland (DOC 2014b), defined as lands enrolled in Williamson Act or Farmland Security Zone contracts by the regional consultant. There are 670 acres of farmlands protected by private programs such as the Williamson Act). The results indicated that 3 percent of the land within the project footprint in Merced County is Protected Farmland. This criterion received a score of 20.

5. **Are the farm units containing the site as large as the average-size farming unit in the county?** The average size farm in Merced County was 394 acres in 2012 (USDA 2012), the most recent year for which average farm size data are available. Alternative 1 traverses farm units that are an average of 142 acres, or approximately 36 percent of the size of the average farm unit in the county. This criterion received a score of 0.

6. **How much of the remaining land on the farm will become nonfarmable if this site is selected?** In some areas, the alignment of Alternative 1 deviates from transportation corridors and bisects or otherwise severs agricultural parcels. Some of the remnant parcels resulting from this severance may not be viable for continued agricultural use. The regional consultant team used GIS software to identify parcels of Important Farmland that would be 20 acres or less following severance due to construction of the project. It was assumed that parcels greater than 20 acres would be viable for continued agricultural use. Analysts then evaluated the characteristics of each of the remnant parcels of 20 acres or less using criteria described in Appendix C, Remnant Parcel Analysis, to determine which parcels would be viable for continued agricultural use and which parcels would likely result in conversion to nonagricultural use. The acreage of the remnant parcels determined not viable for continued agricultural use was compared to the acreage of the original parcels (ARWS 2018a, 2018b, 2018c, 2018d). The results indicated that the acreage of nonviable remnant parcels on farmable land would total less than 1 percent of the acreage of the original parcels within the project footprint of this alternative. This criterion received a score of 0.

7. **Does the site have available adequate supply of farm support services and markets?** According to the Merced County Agricultural Commissioner (Robinson pers. comm.), the area in the vicinity of Alternative 1 has been farmed for 50 to 100 years and it has mostly adequate support services and markets. For example, there are some specialty crops in Merced County where farmers may feel the farm service supply within the county is inadequate. Conversely farmers of more common crops such as almonds would likely have more than adequate farm service supplies within the county. This alternative would have a limited effect on farm services. This criterion received a score of 5.

8. **Does this site have substantial and well-maintained on-farm investments such as barns, fruit trees and vines, field terraces, drainage, irrigation, waterways, and other soil and water conservation measures?** According to satellite imagery analysis of the area around Alternative 1 performed by the regional consultant, the overall amount of on-farm investment is high. Ancillary agricultural structures, barns, irrigation lines, waterways, and drainage ditches were observed on the farms. Soil and water conservation measures have been applied to many of the fields. This criterion received a score of 20.

9. **Would this project, by converting the land to nonagricultural use, reduce the support for farm support services in the area?** The regional consultant overlaid the alternative on a map of the FMMP categories to determine how many acres of Important Farmland would be permanently converted by Alternative 1, plus acreage of nonviable remnant parcels less than 20 acres (i.e., those that have shape, size, location, or hardship that would make them nonviable for continued agricultural use) (ARWS 2018a, 2018b, 2018c, 2018d). Considering there are approximately 1,157,906 acres of Important Farmland and Grazing Land in Merced County (DOC 2016), the permanent conversion of 696 acres of Important Farmland and

Grazing in Merced County under Alternative 1, or less than 0.1 percent of the total Important Farmland in the County, is unlikely to result in reduction in demand for farm support services in the area. This criterion received a score of 0.

10. **Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of the surrounding farmland to nonagricultural use?** The project would include construction of the San Jose Diridon Station and a second station in either downtown Gilroy or east Gilroy, depending on the alternative selected. Stations have the potential to induce population growth and farmland conversion. However, neither station would be located in Merced County.

    There are two locations under consideration for a maintenance of way facility (MOWF) but both are in Gilroy, in Santa Clara County, not in Merced County. In addition, one maintenance of infrastructure siding facility (MOIS) is proposed in Merced County west of Turner Island Road. The MOIS facility would be a small facility, would be compatible with adjacent agricultural uses, and would not induce urban development.

    Alternative 1 would involve the construction of new track, traction power substations (TPSS), and automated train control (ATC) sites. In contrast to stations, which could induce population growth and farmland conversion, guideway use and power or electrical facilities are largely compatible with adjacent agriculture and would not induce urban development. Therefore, it is unlikely that guideway use would contribute to eventual conversion of surrounding farmland to nonagricultural use. This criterion received a score of 2.

Additional Notes

Alternative 1 is tied with Alternatives 2 and 4 for the longest length at approximately 89 miles, with 32 miles in Merced County.

Alternative 2

A. **Total acres to be converted directly?** The regional consultant used the same methodology described in Question A for Alternative 1. The results indicate that a total of 616 acres would be directly permanently converted.

B. **Total acres to be converted indirectly or to receive services?** The regional consultant used the same methodology described in Question B for Alternative 1. The results indicate that a total of 80 acres would be indirectly converted.

C. **Total acres in corridor?** The regional consultant used the same methodology described in Question C for Alternative 1. The results indicate that a total of 696 acres would be directly and indirectly permanently converted.

1. **How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?** The regional consultant used the same methodology described in Criterion 1 for Alternative 1. The results indicated that 97 percent of the total acreage within the buffer was nonurban use. This criterion received a score of 15.

2. **How much of the perimeter of the site borders on land in nonurban use?** The regional consultant used same methodology described in Criterion 2 for Alternative 1. The results indicated that 97 percent of the perimeter of the alternative borders on land in nonurban use. This criterion received a score of 10.

3. **How much of the site has been farmed more than 5 of the last 10 years?** According to satellite imagery analysis of the project footprint for the years between 2005 and 2015 as well as information from the Merced County Agricultural Commissioner (Robinson pers. comm.), in general, some properties in the vicinity of this alternative have been consistently farmed for 10 or more years. This criterion received a score of 11.

4. **Is the site subject to state or local government policies or programs to protect farmland or covered by private programs to protect farmland?** The regional consultant used the same methodology described in Criterion 4 for Alternative 1. There are 670 acres of

farmlands protected by private programs such as the Williamson Act. The results indicated that 3 percent of the land within the project footprint in Merced County is Protected Farmland. This criterion received a score of 20.

5. **Are the farm units containing the site as large as the average-size farming unit in the county?** The regional consultant used the same methodology described in Criterion 5 for Alternative 1. Alternative 2 traverses farm units that are an average of 142 acres, or approximately 36 percent of the size of the average farm unit. This criterion received a score of 0.

6. **How much of the remaining land on the farm will become nonfarmable if this site is selected?** The regional consultant used the same methodology described in Criterion 6 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). The results indicated that the acreage of nonviable remnant parcels on farmable land would total less than 1 percent of the acreage of the original parcels within the project footprint of this alternative. This criterion received a score of 0.

7. **Does the site have available adequate supply of farm support services and markets?** The regional consultant used the same methodology described in Criterion 7 for Alternative 1. This alternative would have a limited effect on farm services. This criterion received a score of 5.

8. **Does this site have substantial and well-maintained on-farm investments such as barns, fruit trees and vines, field terraces, drainage, irrigation, waterways, and other soil and water conservation measures?** The regional consultant used the same methods described in Criterion 8 for Alternative 1. The overall amount of on-farm investment is high. Ancillary agricultural structures, barns, irrigation lines, waterways, and drainage ditches were observed on the farms. Soil and water conservation measures have been applied to many of the fields. This criterion received a score of 20.

9. **Would this project, by converting the land to nonagricultural use, reduce the support for farm support services in the area?** The regional consultant used the same methodology described in Criterion 9 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). Considering there are approximately 1,157,906 acres of Important Farmland and Grazing Land in Merced County (DOC 2016), the permanent conversion of 696 acres of Important Farmland and Grazing Land in Merced County under Alternative 2, or less than 0.1 percent of the total Important Farmland in the County, is unlikely to result in reduction in demand for farm support services in the area. This criterion received a score of 0.

10. **Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of the surrounding farmland to nonagricultural use?** The project would include construction of the San Jose Diridon Station and a second station in either downtown Gilroy or east Gilroy, depending on the alternative selected. Stations have the potential to induce population growth and farmland conversion. However, neither station would be located in Merced County.

    There are two locations under consideration for a MOWF but both are in Gilroy, not in Merced County. In addition, one MOIS facility is proposed in Merced County west of Turner Island Road. The MOIS facility would be a small facility, would be compatible with adjacent agricultural uses, and would not induce urban development.

    Alternative 2 would involve the construction of new track, TPSSs, and ATC sites. In contrast to stations, which could induce population growth and farmland conversion, guideway use and power or electrical facilities are largely compatible with adjacent agriculture and would not induce urban development. Therefore, it is unlikely that guideway use would contribute to eventual conversion of surrounding farmland to nonagricultural use. This criterion received a score of 2.

Additional Notes

Alternative 2 is tied with Alternatives 1 and 4 for the longest length at approximately 89 miles, with 32 miles in Merced County.

Alternative 3

A. **Total acres to be converted directly?** The regional consultant used the same methodology described in Question A for Alternative 1. The results indicate that a total of 616 acres would be directly permanently converted.

B. **Total acres to be converted indirectly or to receive services?** The regional consultant used the same methodology described in Question B for Alternative 1. The results indicate that a total of 80 acres would be indirectly converted.

C. **Total acres in corridor?** The regional consultant used the same methodology described in Question C for Alternative 1. The results indicate that a total of 696 acres would be directly and indirectly permanently converted.

1. **How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?** The regional consultant used the same methodology described in Criterion 1 for Alternative 1. The results indicated that 97 percent of the total acreage within the buffer was nonurban use. This criterion received a score of 15.

2. **How much of the perimeter of the site borders on land in nonurban use?** The regional consultant used same methodology described in Criterion 2 for Alternative 1. The results indicated that 97 percent of the perimeter of the alternative borders on land in nonurban use. This criterion received a score of 10.

3. **How much of the site has been farmed more than 5 of the last 10 years** According to satellite imagery analysis of the project footprint for the years between 2005 and 2015 as well as information from the Merced County Agricultural Commissioner (Robinson pers. comm.), in general, some properties in the vicinity of this alternative have been consistently farmed for 10 or more years. This criterion received a score of 11.

4. **Is the site subject to state or local government policies or programs to protect farmland or covered by private programs to protect farmland?** The regional consultant used the same methodology described in Criterion 4 for Alternative 1. There are 670 acres of farmlands protected by private programs such as the Williamson Act. The results indicated that 3 percent of the land within the project footprint in Merced County is Protected Farmland. This criterion received a score of 20.

5. **Are the farm units containing the site as large as the average-size farming unit in the county?** The regional consultant used the same methodology described in Criterion 5 for Alternative 1. Alternative 3 traverses farm units that are an average of 142 acres, or approximately 36 percent of the size of the average farm unit in the county. This criterion received a score of 0.

6. **How much of the remaining land on the farm will become nonfarmable if this site is selected?** The regional consultant used the same methodology described in Criterion 6 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). The results indicated that the acreage of nonviable remnant parcels on farmable land would total less than 1 percent of the acreage of the original parcels within the project footprint of this alternative. This criterion received a score of 0.

7. **Does the site have available adequate supply of farm support services and markets?** The regional consultant used the same methodology described in Criterion 7 for Alternative 1. This alternative would have a limited effect on farm services. This criterion received a score of 5.

8. **Does this site have substantial and well maintained on-farm investments such as barns, fruit trees and vines, field terraces, drainage, irrigation, waterways, and other**

soil and water conservation measures? The regional consultant used the same methods described in Criterion 8 for Alternative 1. The overall amount of on-farm investment is high. Ancillary agricultural structures, barns, irrigation lines, waterways, and drainage ditches were observed on the farms. Soil and water conservation measures have been applied to many of the fields. This criterion received a score of 20.

9. **Would this project, by converting the land to nonagricultural use, reduce the support for farm support services in the area?** The regional consultant used the same methodology described in Criterion 9 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). Considering there are approximately 1,157,906 acres of Important Farmland and Grazing Land in Merced County (DOC 2016), the permanent conversion of 696 acres of Important Farmland and Grazing Land in Merced County under Alternative 3, or less than 0.1 percent of the total Important Farmland in the County, is unlikely to result in reduction in demand for farm support services in the area. This criterion received a score of 0.

10. **Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of the surrounding farmland to nonagricultural use?** The project would include construction of the San Jose Diridon Station and a second station in either downtown Gilroy or east Gilroy, depending on the alternative selected. Stations have the potential to induce population growth and farmland conversion. However, neither station would be located in Merced County.

    There are two locations under consideration for a MOWF but both are in Gilroy, not Merced County. In addition, one MOIS facility is proposed in Merced County west of Turner Island Road. The MOIS facility would be a small facility, would be compatible with adjacent agricultural uses, and would not induce urban development.

    Alternative 3 would involve the construction of new track, TPSSs, and ATC sites. In contrast to stations, which could induce population growth and farmland conversion, guideway use and power or electrical facilities are largely compatible with adjacent agriculture and would not induce urban development. Therefore, it is unlikely that guideway use would contribute to eventual conversion of surrounding farmland to nonagricultural use. This criterion received a score of 2.

Additional Notes

Alternative 3 is the shortest alternative at 87 miles long, with 32 miles in Merced County.

Alternative 4

A. **Total acres to be converted directly?** The regional consultant used the same methodology described in Question A for Alternative 1. The results indicate that a total of 616 acres would be directly permanently converted.

B. **Total acres to be converted indirectly or to receive services?** The regional consultant used the same methodology described in Question B for Alternative 1. The results indicate that a total of 80 acres would be indirectly converted.

C. **Total acres in corridor?** The regional consultant used the same methodology described in Question C for Alternative 1. The results indicate that a total of 696 acres would be directly and indirectly permanently converted.

1. **How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?** The regional consultant used the same methodology described in Criterion 1 for Alternative 1. The results indicated that 97 percent of the total acreage within the buffer was nonurban use. This criterion received a score of 15.

2. **How much of the perimeter of the site borders on land in nonurban use?** The regional consultant used the same methodology described in Criterion 2 for Alternative 1. The results indicated that 97 percent of the perimeter of the alternative borders on land in nonurban use. This criterion received a score of 10.

3. **How much of the site has been farmed more than 5 of the last 10 years?** According to satellite imagery analysis of the project footprint for the years between 2005 and 2015 as well as information from the Merced County Agricultural Commissioner (Robinson pers.comm.), in general, some properties in the vicinity of this alternative have been consistently farmed for 10 or more years. This criterion received a score of 11.
4. **Is the site subject to state or local government policies or programs to protect farmland or covered by private programs to protect farmland?** The regional consultant used the same methodology described in Criterion 4 for Alternative 1. There are 670 acres of farmlands protected by private programs such as the Williamson Act. The results indicated that 3 percent of the land within the project footprint in Merced County is Protected Farmland. This criterion received a score of 20.
5. **Are the farm units containing the site as large as the average-size farming unit in the county?** The regional consultant used the same methodology described in Criterion 5 for Alternative 1. Alternative 4 traverses farm units that are an average of 142 acres, or approximately 36 percent of the size of the average farm unit. This criterion received a score of 0.
6. **How much of the remaining land on the farm will become nonfarmable if this site is selected?** The regional consultant used the same methodology described in Criterion 6 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). The results indicated that the acreage of nonviable remnant parcels on farmable land would total less than 1 percent of the acreage of the original parcels within the project footprint of this alternative. This criterion received a score of 0.
7. **Does the site have available adequate supply of farm support services and markets?** The regional consultant used the same methodology described in Criterion 7 for Alternative 1. This alternative would have a limited effect on farm services. This criterion received a score of 5.
8. **Does this site have substantial and well-maintained on-farm investments such as barns, fruit trees and vines, field terraces, drainage, irrigation, waterways, and other soil and water conservation measures?** The regional consultant used the same methods described in Criterion 8 for Alternative 1. The overall amount of on-farm investment is high. Ancillary agricultural structures, barns, irrigation lines, waterways, and drainage ditches were observed on the farms. Soil and water conservation measures have been applied to many of the fields. This criterion received a score of 20.
9. **Would this project, by converting the land to nonagricultural use, reduce the support for farm support services in the area?** The regional consultant used the same methodology described in Criterion 9 for Alternative 1 (ARWS 2018a, 2018b, 2018c, 2018d). Considering there are approximately 1,157,906 acres of Important Farmland and Grazing Land in Merced County (DOC 2016), the permanent conversion of 696 acres of Important Farmland and Grazing Land in Merced County under Alternative 4, or less than 0.1 percent of the total Important Farmland in the County, is unlikely to result in reduction in demand for farm support services in the area. This criterion received a score of 0.
10. **Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of the surrounding farmland to nonagricultural use?** The project would include construction of the San Jose Diridon Station and a second station in either downtown Gilroy or east Gilroy, depending on the alternative selected. Stations have the potential to induce population growth and farmland conversion. However, neither station would be located in Merced County.

    There are two locations under consideration for MOWF but both are in Gilroy, not in Merced County. In addition, one MOIS facility is proposed in Merced County west of Turner Island Road. The MOIS facility would be a small facility, would be compatible with adjacent agricultural uses, and would not induce urban development.

Alternative 4 would involve the construction of new track, TPSSs, and ATC sites. In contrast to stations, which could induce population growth and farmland conversion, guideway use and power or electrical facilities are largely compatible with adjacent agriculture and would not induce urban development. Therefore, it is unlikely that guideway use would contribute to eventual conversion of surrounding farmland to nonagricultural use. This criterion received a score of 2.

Additional Notes

Alternative 4 is tied with Alternatives 1 and 2 for the longest length at approximately 89 miles, with 32 miles in Merced County.

NRCS-CPA-106
(Rev. 1-91)

FARMLAND CONVERSION IMPACT RATING FOR CORRIDOR TYPE PROJECTS

PART I *(To be completed by Federal Agency)*	3. Date of Land Evaluation Request	4. Sheet 1 of _____
1. Name of Project	5. Federal Agency Involved	
2. Type of Project	6. County and State	

PART II *(To be completed by NRCS)*	1. Date Request Received by NRCS	2. Person Completing Form
3. Does the corridor contain prime, unique statewide or local important farmland? (If no, the FPPA does not apply - Do not complete additional parts of this form). YES ☐ NO ☐		4. Acres Irrigated | Average Farm Size
5. Major Crop(s)	6. Farmable Land in Government Jurisdiction **Acres:** **%**	7. Amount of Farmland As Defined in FPPA **Acres:** **%**
8. Name Of Land Evaluation System Used	9. Name of Local Site Assessment System	10. Date Land Evaluation Returned by NRCS

PART III *(To be completed by Federal Agency)*	**Alternative Corridor For Segment _____**			
	Corridor A	**Corridor B**	**Corridor C**	**Corridor D**
A. Total Acres To Be Converted Directly				
B. Total Acres To Be Converted Indirectly, Or To Receive Services				
C. Total Acres In Corridor				
PART IV *(To be completed by NRCS) Land Evaluation Information*				
A. Total Acres Prime And Unique Farmland				
B. Total Acres Statewide And Local Important Farmland				
C. Percentage Of Farmland in County Or Local Govt. Unit To Be Converted				
D. Percentage Of Farmland in Govt. Jurisdiction With Same Or Higher Relative Value				
PART V *(To be completed by NRCS) Land Evaluation Information Criterion Relative value of Farmland to Be Serviced or Converted (Scale of 0 - 100 Points)*				
PART VI *(To be completed by Federal Agency) Corridor Assessment Criteria (These criteria are explained in 7 CFR 658.5(c))* — **Maximum Points**				
1. Area in Nonurban Use — **15**				
2. Perimeter in Nonurban Use — **10**				
3. Percent Of Corridor Being Farmed — **20**				
4. Protection Provided By State And Local Government — **20**				
5. Size of Present Farm Unit Compared To Average — **10**				
6. Creation Of Nonfarmable Farmland — **25**				
7. Availablility Of Farm Support Services — **5**				
8. On-Farm Investments — **20**				
9. Effects Of Conversion On Farm Support Services — **25**				
10. Compatibility With Existing Agricultural Use — **10**				
TOTAL CORRIDOR ASSESSMENT POINTS — **160**	0	0	0	0
PART VII *(To be completed by Federal Agency)*				
Relative Value Of Farmland (From Part V) — **100**	0	0	0	0
Total Corridor Assessment (From Part VI above or a local site assessment) — **160**	0	0	0	0
TOTAL POINTS *(Total of above 2 lines)* — **260**	0	0	0	0

1. Corridor Selected:	2. Total Acres of Farmlands to be Converted by Project:	3. Date Of Selection:	4. Was A Local Site Assessment Used? YES ☐ NO ☐

5. Reason For Selection:

Signature of Person Completing this Part: Diana P. Robas | DATE

NOTE: Complete a form for each segment with more than one Alternate Corridor

Clear Form

CORRIDOR - TYPE SITE ASSESSMENT CRITERIA

The following criteria are to be used for projects that have a linear or corridor - type site configuration connecting two distant points, and crossing several different tracts of land. These include utility lines, highways, railroads, stream improvements, and flood control systems. Federal agencies are to assess the suitability of each corridor - type site or design alternative for protection as farmland along with the land evaluation information.

(1) How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?
More than 90 percent - 15 points
90 to 20 percent - 14 to 1 point(s)
Less than 20 percent - 0 points

(2) How much of the perimeter of the site borders on land in nonurban use?
More than 90 percent - 10 points
90 to 20 percent - 9 to 1 point(s)
Less than 20 percent - 0 points

(3) How much of the site has been farmed (managed for a scheduled harvest or timber activity) more than five of the last 10 years?
More than 90 percent - 20 points
90 to 20 percent - 19 to 1 point(s)
Less than 20 percent - 0 points

(4) Is the site subject to state or unit of local government policies or programs to protect farmland or covered by private programs to protect farmland?
Site is protected - 20 points
Site is not protected - 0 points

(5) Is the farm unit(s) containing the site (before the project) as large as the average - size farming unit in the County ? (Average farm sizes in each county are available from the NRCS field offices in each state. Data are from the latest available Census of Agriculture, Acreage or Farm Units in Operation with $1,000 or more in sales.)
As large or larger - 10 points
Below average - deduct 1 point for each 5 percent below the average, down to 0 points if 50 percent or more below average - 9 to 0 points

(6) If the site is chosen for the project, how much of the remaining land on the farm will become non-farmable because of interference with land patterns?
Acreage equal to more than 25 percent of acres directly converted by the project - 25 points
Acreage equal to between 25 and 5 percent of the acres directly converted by the project - 1 to 24 point(s)
Acreage equal to less than 5 percent of the acres directly converted by the project - 0 points

(7) Does the site have available adequate supply of farm support services and markets, i.e., farm suppliers, equipment dealers, processing and storage facilities and farmer's markets?
All required services are available - 5 points
Some required services are available - 4 to 1 point(s)
No required services are available - 0 points

(8) Does the site have substantial and well-maintained on-farm investments such as barns, other storage building, fruit trees and vines, field terraces, drainage, irrigation, waterways, or other soil and water conservation measures?
High amount of on-farm investment - 20 points
Moderate amount of on-farm investment - 19 to 1 point(s)
No on-farm investment - 0 points

(9) Would the project at this site, by converting farmland to nonagricultural use, reduce the demand for farm support services so as to jeopardize the continued existence of these support services and thus, the viability of the farms remaining in the area?
Substantial reduction in demand for support services if the site is converted - 25 points
Some reduction in demand for support services if the site is converted - 1 to 24 point(s)
No significant reduction in demand for support services if the site is converted - 0 points

(10) Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of surrounding farmland to nonagricultural use?
Proposed project is incompatible to existing agricultural use of surrounding farmland - 10 points
Proposed project is tolerable to existing agricultural use of surrounding farmland - 9 to 1 point(s)
Proposed project is fully compatible with existing agricultural use of surrounding farmland - 0 points

APPENDIX 3.14-C: REMNANT PARCEL ANALYSIS

APPENDIX 3.14-C: REMNANT PARCEL ANALYSIS

Remnant Parcel Analysis

The identification of nonviable remnant parcels of Important Farmland in the San Jose to Central Valley Wye Project Extent (project extent or project) required a two-step process. In Step 1, analysts used geographic information system (GIS) software to identify remnant parcels of Important Farmland that would be 20 acres or less following severance as a result of project construction. These severed parcels of Important Farmland were provisionally considered nonviable remnants that could be converted to a nonagricultural use. The parcels of more than 20 acres were considered viable for continued agricultural use and were not included in this analysis.

In Step 2, analysts reviewed the characteristics of the remnant parcels identified in Step 1 on a parcel-by-parcel basis to identify those parcels likely to remain in agricultural use and those likely to be converted to nonagricultural use. Analysts used the following criteria to determine the viability of continued agricultural use of remnant parcels or likely conversion to a nonagricultural use.

- **Access—**Would the project restrict or eliminate access to the remnant parcel such that it can no longer continue in agricultural use (e.g., proposed roadway closure or severance, or permanent high-speed rail (HSR) fencing around tracks, electrical stations or maintenance roads)?
- **Size and shape—**Would the project create a parcel too small or oddly shaped to be viable for agriculture, even if combined with adjacent agricultural parcels?
- **Location—**Would the project create a parcel that could not be consolidated with adjacent agricultural parcels because of location?
- **Hardship—**Would the project create a severance that causes an overall hardship in maintaining economic activity on what might otherwise appear to be an economically viable remnant parcel?

Tables 1, 2, 3, and 4 show all parcels that were identified under Step 1 for each alternative and the results of the analysis described under Step 2 to identify viable parcels likely to continue in agricultural use and nonviable parcels not likely to continue in agricultural use (ARWS 20181, 2018b). Attachments 1 through 7 contain mapbooks showing the location of severed parcels for each alternative by subsection.

APN = assessor's parcel number
— = No APN provided for remnant parcel.
1 The first remnant ID listed applies to the Monterey Corridor—Skyway Drive Variant A. The second remnant ID listed applies to the Monterey Corridor—Skyway Drive Variant B. Remnant parcel information is the same for both options.

APPENDIX 3.14-D: INDUCED WIND IMPACTS: EFFECTS ON POLLINATION; BLOSSOMS AND DUST

California High Speed Rail Authority

Induced Wind Impacts

Effects on Pollination; Blossoms and Dust

Agricultural Working Group White Paper

Approved: 7/2/2012

BACKGROUND

The California High Speed Rail Authority (CHSRA) proposes to connect the large population centers in California and thus establish a new railway in the San Joaquin Valley. The new rail alignment is proposed to be constructed either on existing farmland or adjacent to, where such land lies between urban and commercial parcels in the Valley. Most, if not all, of the Valley counties through which the railway is proposed to travel have Right-To-Farm Ordinances which make reference to "customary and/or traditional" agricultural practices. The proposed project has raised questions and concerns regarding its impact on many established and customary agricultural practices and consequent potential imposition of new regulatory restrictions. Customary agricultural practices found in the Valley are as varied as is the diversity of agricultural products and commodities produced. The San Joaquin Valley as a natural resource is unique to the state, the nation, and arguably the world by the quality and quantity in the diversity of its agriculture.

The CHSRA has created a "technical" agricultural working group to assist the CHSRA in responding to the more technically oriented questions and concerns that have been asked regarding impacts to agriculture resulting from activities during the construction phase and the daily operation of the High Speed Train (HST). The agricultural working group membership is comprised of members in possession of technical expertise in various categories of agriculture activities and infrastructure.

ISSUE

Concern is expressed that the High Speed Train while traveling at 220mph will create wind currents that will affect pollination by damaging blossoms, disrupt bee pollination activity, reduce crop production due to dust, and cause pesticide drift. Each of these will be reviewed in this paper under individual sections.

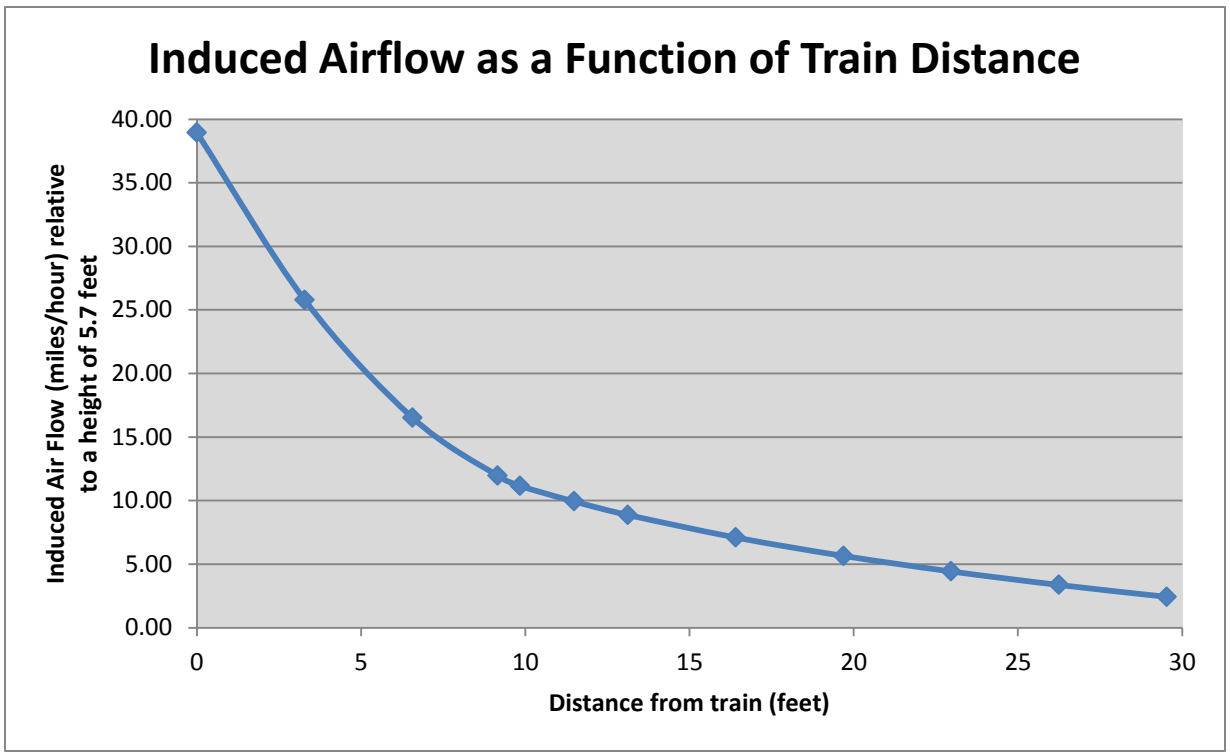
DISCUSSION

WIND SPEED

Any effects of induced wind by the HST on pollination will be a matter of the wind speed generated. Estimates of the generated wind speed were made independently, by separate engineering consultants using different methodologies (see attached Technical Memorandum: Potential Impact from Induced Winds for High-Speed Trains). Various reference sources were used. One of these is from Professors Sterling and Baker, both professors at the School of Civil Engineering, at the University of Birmingham, Birmingham, UK. Their studies focus mainly on the impact of induced wind (which they refer to as the "slipstream") on people waiting along the track (both workers and public) in regards to safety. Their recent paper (Sterling et al., 2008) presents two sets of induced wind profiles from the German Intercity Connect (ICE) high speed train. They indicated that they considered these to be high quality data that show the slipstream velocity as a function of the distance from the train. These data show that for trackside measurements the induced winds are between 5% and 10% of the speed of the train at 3 meters (~10ft) from the side of the train.

A second reference, (Li, et.al, "A Study of the Influence of Aerodynamic Forces on a Human Body near a High-Speed Train, Aerodynamics of Heavy Vehicles, Trucks, Buses, and Trains", 2008) utilized a curve fit

equation for estimating the wind speed and is charted below. The equation can be used up to 30ft. At this distance the estimated wind speed is approximately 2.4mph as shown in the following chart.



Induced Airflow as a Function of Distance for a Train Traveling at 220mph

Note that at 10ft from the side of the train this chart shows an approximate wind speed of 11.2mph which is within the 5-10% predicted from the research noted above (11-22mph for a HST at 220mph). These speeds are comparable to and under the meteorological data for Daily Average Wind Speed from both the Merced and Fresno airport reporting stations. The HST Right of Way standard when at grade is 100 feet wide with the two tracks being centered and 16.5 feet apart. The distance of 30 feet falls well within the HST Right of Way.

POLLINATION

The potential impact to pollinators, such as the honey bee, is discussed with in a separate White Paper; Bees and Pollination.

BLOSSOMS

The potential impact to blossoms and/or flowering trees has also been raised as a concern particularly in regards to the pollination thereof as well as the physical impact of wind to leaves and blossoms. As noted above, the HST induced wind would dissipate to about 2mph as it reaches the edge of the Right of Way. A comparable wind statistic is the Daily Average Peak Gust, where a Peak Gust is a maximum 5-second average wind speed. The meteorological data from the Western Regional Climate Center for Merced Regional Airport (1998-2008), Fresno Yosemite International Airport (1996-2008), and

Bakersfield Meadows Field Airport (196-2008) show Daily Average Peak Gusts ranged from 15.0mph to 21.3mph, 14.2mph to 21.7mph, and 14.7 mph to 21.4 mph respectively.

Throughout the season, farmers apply different crop protection products for various plant problems. Materials may be applied by airplane, helicopter, or ground units and are most commonly applied with ground based air blast spray units that have adequate air volume and speed to carry spray materials to their target which might be as far as 30 feet from the sprayer. Some of these applications occur while blossoms are present on the trees. In discussion with the manufacturer of the "Air-o-Fan" sprayer, it was noted that the velocity of air from the fan was around 140mph at the exit of the fan (Air-O-Fan Model: D-40R, (Specifications Attached). The distance from the fan and its target determines the cubic feet per minute needed to displace the internal air of the canopy. In this example, the range quoted was 40,000cfm to 350,000cfm.

Therefore, it is expected the HST will not create conditions that will cause blossom loss.

DUST

In arid agriculture conditions such as in the San Joaquin Valley, there are two main impacts of dust on plant foliage: photosynthesis and pests (spider mites). While there are other impacts to consider, they are generally not significant enough to be considered damaging.

Excess dust on leaves will decrease photosynthesis of the plant and have a stressing effect on the leaf's ability for respiration. A decrease in photosynthesis is a result of the reduced sunlight penetrating the dust to the leaf and can reduce the plant's productive capacity. The leaf is a plant's primary means of cooling itself by the process of transpiration. Excessive dust can inhibit transpiration, allowing leaf temperatures to rise and causing a negative effect on plant stress load.

These stresses create conditions in arid climates that have been demonstrated to foster spider mite infestations. Primary spider mite species are the Pacific, Two-spotted, and European Red spider mite, while others can be problematic at times on certain varieties of plants (e.g. Russet and Willamette spider mites). Spider mite webbing can worsen the dust collection on the plant. Spider mites also feed on the moisture in the leaves by sucking on the cell materials for their survival and multiplication. The results of this activity can cause defoliation and lower production significantly.

There are materials that can control spider mite populations, but generally the lower the dust pressure the less significant the mite pressure will be in a field. Watering roads and other dust control measures often are practiced to slow mite buildup, particularly on the perimeter of fields from where mites typically encroach. Environmentally, the mite population is most affected by moisture in the daily cycle of heating and cooling. This usually happens in the fall of the year when temperatures fall and nights become longer.

Traffic for maintenance of rail should most often be between 12:00 a.m. and 5:00 a.m., which is during the period of day when dew is most prevalent helping keep atmospheric dust to a minimum. It is

anticipated that most HST maintenance equipment will travel on the steel rails which also helps eliminate dust as it is not in contact with soil.

During construction of the HST system, contractors are obligated to control fugitive dust in accordance with California Air Resources Board and San Joaquin Valley Air Pollution Control District permits, therefore construction should have no significant impacts on adjacent crops.

Velocities within the HST Right of Way will be higher and appropriate ground maintenance should be part of standard operation procedures to further minimize the potential for conditions related to dust creation. Dust generation due to the potential for additional farm roads (related to split parcels) along the HST Right of Way may affect specific farm operations. The need for revised "Dust Plans" or operational changes, including cost impacts, would be addressed within the Right of Way process.

Therefore the HST will not create significant dust resulting in increased pests such as spider mites.

DRIFT (OF PESTICIDES)

As noted within the Agricultural Working Group White Paper on pesticide use, existing laws prohibit drift from pesticide applications. Current pesticide application practices include both ground and aerial applications. These methods are used successfully for application of pesticides in areas with transportation routes presently (roads, highways and railroads). Also noted within the AWG White Paper on pesticide use is that the HST Right of Way would be treated the same as other transportation routes. Thus concern regarding potential pesticide drift relates to the ability for the HST induced wind to draw [move] pesticides from an adjacent field into the Right of Way or into another adjoining field.

There is the general practice that the application of pesticides is not performed in winds that exceed 5-10mph. The actual limiting of application is determined by factors such as pesticide label instructions, the experience of the applicator, the perceived risk of drift involved and specific application conditions and regulations.

The situation of the HST moving pesticides from an adjacent field into the HST Right of Way or into an adjoining field is not reasonably foreseeable as a result of the wind speeds noted above.

CONCLUSION

The HST induced wind is not excessive at the edge of the right-of-way.

The effect of HST on blossoms and flowering trees is minimal due to the expected wind speed at the edge of the right-of-way.

The effect of HST induced wind on creating dust is minimal due to the expected wind speed at the edge of the right-of-way.

The risk of HST induced wind creating conditions to cause pesticide drift is minimal due to the expected wind speed at the edge of the right-of-way.

APPENDIX 3.14-E: WILLIAMSON ACT COMPLIANCE DATA

Table 1 shows the total acres and number of parcels of protected farmland (i.e., under Williamson Act contracts) that would be directly affected by the San Jose to Central Valley Wye Project Extent (project) alternatives in Santa Clara, San Benito, and Merced Counties.[1] Protected agricultural land that would be taken out of production by the project ranges from 944.4 acres under Alternative 4 to 1,042.7 acres under Alternative 3. Alternatives 1 and 2 would see intermediate acreages of protected agricultural land removed from production, at 952 acres and 956.4 acres respectively.

Tables 2a through 2d show the individual parcels under Williamson Act contracts, including those currently under contract nonrenewal,[2] that could be affected by each project alternative.[3] The tables include existing parcel size and the remainder parcel size after construction of the project. Parcels that no longer meet the minimum Williamson Act contract acreage in Santa Clara, San Benito, and Merced Counties may no longer qualify for Williamson Act contract. [4]

Table 3 shows the county parcel size thresholds for Williamson Act contracts for Santa Clara, San Benito, and Merced Counties.

Table 4 shows the estimated total acres and number of remainder parcels of protected farmland under each alternative. The acreage for the remainder parcels would be smaller than each county's threshold for protected farmland contracts. Agricultural land acreage protected under the Williamson Act that potentially could fall below county thresholds ranges from 797.6 acres for Alternative 4 to 890.4 acres for Alternative 3. Alternatives 1 and 2 would see intermediate acreages of remainder parcels protected agricultural land under county thresholds: 849.4 and 876 acres respectively.[5]

[1] There would be no permanent effects from implementation of network interconnections in Santa Clara, San Benito, and Merced Counties; therefore, no further discussion is required.

[2] The term *nonrenewal* refers to the method of terminating a Williamson Act or Farmland Security Zone contract by filing a notice of nonrenewal. The contract is terminated 10 years from the time of notice of nonrenewal. Nonrenewal can be initiated by the landowner or the local government.

[3] None of the three counties that would be affected by the project participate in the Farmland Security Zone program.

[4] Total acreages do not exactly match total acreages presented in the Agricultural Farmland Technical Report (the technical report to which this appendix is attached) or EIR/EIS Section 3.14 (Agricultural Farmland) . This is because the county parcel data presented in this appendix include some road gaps and parcel overlaps at county boundaries between parcels in the detailed parcel-level analysis, whereas the acreages presented in the Agricultural Farmland Technical Report and Section 3.14 analyses are based on continuous data with no gaps for roads or overlaps at county boundaries. While the data sets do not correspond, they both are accurate calculations based on the underlying data.

[5] See previous footnote.

Sources: County of Merced 2017, County of San Benito 2017, County of Santa Clara 2017
APN = assessor's parcel number
a Parcel 081-060-060-000 is recorded in different Merced County databases with different acreages: Assessor's Office records 221.5 acres, GIS department records 225.1 acres (the value used in this report), and the Williamson Act contract from 2001 records 223.2 acres. This may be the result of portions of road being included in gross acreage numbers which are not included in the taxable portion of the parcel.

APN = assessor's parcel number

a Parcel 081-060-060-000 is recorded in different Merced County databases with different acreages: Assessor's Office records 221.5 acres, GIS department records 225.1 acres (the value used in this report), and the Williamson Act contract from 2001 records 223.2 acres. This may be the result of portions of road being included in gross acreage numbers which are not included in the taxable portion of the parcel.

Sources: County of Merced 2017, County of San Benito 2017, County of Santa Clara 2017
APN = assessor's parcel number
a Parcel 081-060-060-000 is recorded in different Merced County databases with different acreages: Assessor's Office records 221.5 acres, GIS department records 225.1 acres (the value used in this report), and the Williamson Act contract from 2001 records 223.2 acres. This may be the result of portions of road being included in gross acreage numbers which are not included in the taxable portion of the parcel.

Table 3 County Parcel Size Thresholds for Williamson Act Contracts (acres)

Counties	Prime[1]	Nonprime[1]
Santa Clara County	10	40
San Benito County	(1) 10 acres of orchards, vineyards or irrigated vegetable and field crops;(2) 40 acres of irrigated pasture or dry-land farmed land; (3) 160 acres of grazing land; or (4) a combination of actual acreage in any of the above categories, provided that the sum of the percentages in any of the above categories equals or exceeds 100%	
Merced County[2]	10	40

[1] Prime and nonprime refers to land on soils classified by Natural Resources Conservation Service as Prime or nonprime.

[2] As of August 18, 2009, Merced County Board of Supervisors determined that the County would no longer accept new land under Williamson Act contract because the State of California ceased tax reimbursement payments.

APPENDIX 3.17-A: CORRESPONDENCE

Since publication of the Draft Environmental Impact Report (EIR)/Environmental Impact Statement (EIS), the following substantive changes have been made to this appendix:

- Added further correspondence from 2018 through July 2021 .

San Jose to Merced Section Interested Parties Consultation Log 2010 to Present

Consultation Date	Action	Interested Party	Description of Consultation
8/26/2010	Letter	History San Jose, Jim Reed	Consultant provides information about the project regarding the San Francisco to San Jose and San Jose to Merced Project Sections; specifically in regard to the San Jose to Merced Project Section, requesting information regarding historic properties/resources.
8/26/2010	Letter	San Jose Planning Division: Department of Planning, Building, and Code Enforcement, John Davidson	Consultant provides information about the project and some historic resources regarding the San Francisco to San Jose and San Jose to Merced Project Sections, and requests information and input regarding other historic properties/resources.
8/26/2010	Letter	Santa Clara County Department of Planning and Development, Dana Peak	Consultant provides information about the project and some historic resources in the project area regarding the San Francisco to San Jose and San Jose to Merced Project Sections, and requests information and input regarding historic properties/resources.
8/26/2010	Letter	Santa Clara County Historical and Genealogical Society	Consultant provides information about the project regarding the San Francisco to San Jose and San Jose to Merced Project Sections, and requests information and input regarding historic resources.
11/2/2015	Letter	Brisbane Planning Department, Community Development Department, John Swiecki (jswiecki@ci.brisbane.ca.us)	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	Burlingame Historical Society, Jennifer Pfaff (jjpf@pacbell.net)	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	California Heritage Council, Christopher Layton	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	California Historical Society, Anthea Hartig PhD (ahartig@calhist.org)	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	California Preservation Foundation, Cindy Heitzman	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	Caltrans District 10, Ben Broyles (ben_broyles@dot.ca.gov)	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.

Consultation Date	Action	Interested Party	Description of Consultation
11/2/2015	Letter	Caltrans District 4, Brett Rushing (brett.rushing@dot.ca.gov)	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	Caltrans District 5, Krista Kiaha (krista.kiaha@dot.ca.gov)	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	History San Jose, Alida J. Bray (abray@historyjanjose.org)	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	Preservation Action Council San Jose	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	Railroad Station Historical Society, Jim Dent (jdent1@optonline.net)	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	Redwood City Historic Resources Advisory Committee, Seth Adams (sadams@redwoodcity.org)	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	San Jose Historical Landmarks Commission, Martina Davis	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	San Jose Planning Division Department of Planning, Building, and Code Enforcement, Jason Rogers	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	San Jose Planning Division Department of Planning, Building, and Code Enforcement, John Davidson	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	Santa Clara County Department of Planning and Development, Kirk Girard (kirk.girard@pln.sccgov.org)	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	Santa Clara County Historical and Genealogical Society, Jane Harmer	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	Santa Clara County Historical Heritage Commission, La'Tria Strother (latria.strother@cob.sccgov.org)	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.

Consultation Date	Action	Interested Party	Description of Consultation
11/2/2015	Letter	Santa Clara Valley Transit Authority Planning and Program Development, Lauren Bobadilla (retired)	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	Society of California Pioneers-Seymour Pioneer Museum Mercedes, Moore Devine (mmdevine@californiapioneers.org)	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/2/2015	Letter	South Bay Historical Railroad Society, Inc. ([info@sbhrs.org)	Authority sends information and request for input to San Francisco to San Jose and San Jose to Merced Project Sections interested parties regarding the Merced to Fresno: Central Valley Wye.
11/16/2015	Email	Burlingame Historical Society - Jennifer Pfaff	Ms. Pfaff confirms intent to be a consulting party.
11/16/2015	Email	Brisbane Planning Department - Community Development Department - John Swiecki	Mr. Swiecki responds on behalf of Brisbane to become a consulting party.
12/14/2015	Email	Redwood City - Seth Adams	Seth Adams responds on behalf of Redwood City to become consulting party
12/17/2015	Teleconference	City of San Jose Planning Department, Jason Rogers, and San Jose Historical Landmarks Commission, Martina Davis	Jason Rogers (Planning Director for City of San Jose Planning Department) and Martina Davis (San Jose Historical Landmarks Commission) requested conference call with Authority in response to November 2, 2015, outreach letter regarding both San Francisco to San Jose and San Jose to Merced Project Sections. Davis and Rogers are working on the Diridon Station area and requested communication be maintained to ensure that best practices regarding historic preservation are well coordinated.
5/12/2016	Flyer attached; Email	AMardesich@cityofsancarlos.org	In November of 2015, the Authority sent a letter with current information regarding the advancement of the project section between San Jose and Merced. We are continuing to move ahead and wanted to call attention to some community open house meetings that are planned this month specifically for the San Jose to Merced Project Section, which spans Santa Clara, San Benito, Merced, and Madera Counties.
5/12/2016	Flyer attached; Email	Atherton Heritage Association (meo@rjoster.com)	In November of 2015, the Authority sent a letter with current information regarding the advancement of the project section between San Jose and Merced. We are continuing to move ahead and wanted to call attention to some community open house meetings that are planned this month specifically for the San Jose to Merced Project Section, which spans Santa Clara, San Benito, Merced, and Madera Counties. Response: Delivery to these recipients or groups is complete, but no delivery notification was sent by the destination server.

Consultation Date	Action	Interested Party	Description of Consultation
5/12/2016	Flyer attached; Email	Atherton Planning Department (hking@ci.atherton.ca.us)	In November of 2015, the Authority sent a letter with current information regarding the advancement of the project section between San Jose and Merced. We are continuing to move ahead and wanted to call attention to some community open house meetings that are planned this month specifically for the San Jose to Merced Project Section, which spans Santa Clara, San Benito, Merced, and Madera Counties. Response: Tuesday, May 17, 2016 10:17 AM Thank you for your email. I am no longer working in the Town of Atherton as of May 12, 2016. I have taken a full time position in another jurisdiction. Please forward all planning related questions to Lisa Costa Sanders, lcostasanders@ci.atherton.ca.us Thank you Haleigh King

5/17/2016	Flyer; Email	All Parties on the San Francisco to San Jose and San Jose to Merced Project Sections Interested Parties Lists	Good morning, In November of last year we sent you a letter, along with other local government planning departments, local government heritage/preservation commissions, and historical interest groups, with current information regarding the planning and development of the high-speed rail project section being advanced between San Francisco and San Jose. The purpose of this letter was to invite your participation in the cultural resources investigation that will be conducted in accordance with Section 106 of the National Historic Preservation Act, as well as the National Environmental Policy Act and the California Environmental Quality Act. We are continuing to move ahead with planning for this and other rail sections. I wanted to call your attention to some public scoping meetings that are planned this month specifically for the San Francisco to San Jose Project Section, which spans San Francisco, San Mateo, and Santa Clara Counties. Please see the attached flyer, which provides the dates and locations of the three meetings scheduled to occur this month. Public scoping meetings are a good way to learn more about the project and to speak directly with technical, environmental, and engineering staff. Lisa Costa Sanders (lcostasanders@ci.atherton.ca.us) was emailed separately because Haleigh King no longer works for City of Atherton. Re: Request for Review and Comment on Findings Presented in the *San Jose to Merced Project Section, Section 106 Finding of Effect Report*, Prepared by ICF (February 2020)

Dear Mr. Rushing:

The California High-Speed Rail Authority (Authority) is continuing consultation with the State Historic Preservation Officer (SHPO) regarding the San Jose to Merced Project Section of the California High-Speed Rail (HSR) Program. This consultation is undertaken in accordance with the *2011 Programmatic Agreement Among the Federal Railroad Administration, the Advisory Council on Historic Preservation, the California State Historic Preservation Officer, and the California High-Speed Rail Authority* (PA). The Authority is requesting SHPO comments on the *San Jose to Merced Project Section, Section 106 Finding of Effect Report* (FOE Report) prepared by ICF in February 2020 and on a finding of effect on 21 historic built properties and 33 archaeological resources.

The FOE Report assess effects on built environment and archaeological properties that would result from implementation of the Preferred Alternative for the San Jose to Central Valley Wye Project Extent (Preferred Alternative) of the California High-Speed Rail System. The Preferred Alternative consists of portions of the San Jose to Merced Project Section that extends from Scott Boulevard in San Jose to Carlucci Road in Merced County, the western limit of the Central Valley Wye. The Area of Potential Effects delineated for the San Jose to Merced Project Section Archaeological Survey Report (Authority and FRA 2019) and the San Jose to Merced Project Section Historic Architectural Survey Report (Authority and FRA 2019).

The Preferred Alternative has the potential to adversely affect five built environment historic properties, including three that would be demolished (the Madrone Underpass, Live Oak Creamery, and the Cozzi Family Property). Additionally, construction of new HSR station facilities would remove character-defining features and alter historic setting characteristics of the Southern Pacific Depot in San Jose and diminish the agricultural setting of the Negra Ranch. Mitigation Measures, such as a stipulation to involve stakeholders in the development of interpretive or educational materials, will be developed with consulting parties.

The FOE Report also concludes that the Preferred Alternative would potentially adversely affect two archaeological properties (CA-SCL-30/H and CA-338H) in the APE. Another 31 archaeological resources within the APE are assumed to be eligible for listing on the National Register of Historic Places, although formal evaluation of these resources is pending due to lack

of legal access to parcels and rights-of-way. The assessment of effects for all 33 resources will be phased in accordance with 36 CFR § 800.5(a)(3) and PA Stipulation VI.E and VIII.A.1.

Having reviewed your letter and the FOE Report, SHPO offers the following comments:

- SHPO concurs that, pursuant to 36 CFR § 800.5(a)(1) and (2), the Preferred Alternative has the potential to adversely affect the Southern Pacific Depot in San Jose, the Madrone Underpass, Live Oak Creamery, Negra Ranch, and the Cossi Family Property.

- SHPO concurs that, pursuant to 36 CFR § 800.5(b), the Preferred Alternative will have no adverse effect on the Santa Clara Railroad Complex, Sunlite Baking Co., San Martin Winery, Southern Pacific Station in Gilroy, Pacheco California Department of Forestry Station, and the Cottani Family Property.

- SHPO concurs that, pursuant to 36 CFR § 800.4(d)(1), the preferred alternative will have no effect on Pacific Intertie Transmission Line, Villa Mira Monte, Hoenck House, IOOF Orphanage School, Horace Wilson House, Ellis Ranch, Millers Canal, the California Aqueduct, the Delta Mendota Canal, and the San Joaquin & Kings River Main Canal.

- SHPO agrees that, per 36 CFR § 800.5(a)(3) and PA Stipulation VI.E and VIII.A.1., the phased application of the criteria of adverse effect on 33 archaeological resources identified in Table 2 of the Authority's February 28, 2020 letter is appropriate at this time.

- SHPO has no comments on the format or structure of the FOE Report.

If you have any questions or comments, contact State Historian Tristan Tozer at (916) 445-7027 or at Tristan.Tozer@parks.ca.gov.

Sincerely,

Julianne Polanco
State Historic Preservation Officer

Action	Date	Tribal Representative	Summary
Letter; Email	3/25/2021	Tamien Nation of the Greater Santa Clara County – Quirina Luna Geary	Tribe formally requests notification of the agency's proposed projects, in accordance with Public Resources Code Section 21080.3.1. Authority formally responds on 3/25/2021.
Letter and Participation Form	3/29/2021	Tamien Nation of the Greater Santa Clara County – Quirina Luna Geary	Section 106 consulting party participation form signed by Quirina Luna Geary as the Chairperson of the Tamien Nation.

APPENDIX 3.17-C: ARCHAEOLOGICAL AND BUILT RESOURCES

Appendix 3.17-C includes a map set containing overview maps for potentially affected archaeological resources and potentially affected historic built resources locations, as well as individual historic built resource maps that show project alternative alignments, project footprint boundaries, and potentially affected historic property boundaries. The built resource maps include the identification numbers assigned to individual resources located in the APE. A description of the project scope and evaluation of impacts at each resource are included in Chapter 3.17-C, *Cultural Resources*, and are organized by these resource identification number. Individual archaeological site maps are not included, because the location of such resources is protected from public disclosure under state and federal law.

APPENDIX 3.17-D: PROGRAMMATIC AGREEMENT AMONG THE FRA, THE ACHP, THE SHPO, AND THE AUTHORITY REGARDING COMPLIANCE WITH SECTION 106 OF THE NHPA, AS IT PERTAINS TO THE CALIFORNIA HIGH-SPEED RAIL PROJECT

FIRST AMENDMENT TO THE PROGRAMMATIC AGREEMENT AMONG THE FEDERAL RAILROAD ADMINISTRATION, THE ADVISORY COUNCIL ON HISTORIC PRESERVATION, THE CALIFORNIA STATE HISTORIC PRESERVATION OFFICER, AND THE CALIFORNIA HIGH-SPEED RAIL AUTHORITY REGARDING COMPLIANCE WITH SECTION 106 OF THE NATIONAL HISTORIC PRESERVATION ACT, AS IT PERTAINS TO THE CALIFORNIA HIGH-SPEED TRAIN PROJECT

WHEREAS, the Federal Railroad Administration (FRA), the Advisory Council on Historic Preservation (ACHP or the Council) the California State Historic Preservation Officer (SHPO), and the California High-Speed Rail Authority (Authority) are parties to the *Programmatic Agreement Among the Federal Railroad Administration, the Advisory Council on Historic Preservation, the California State Historic Preservation Officer, and the California High-Speed Rail Authority Regarding Compliance with Section 106 of the National Historic Preservation Act, as it Pertains to the California High-Speed Train Project*, effective July 22, 2011 (Agreement); and

WHEREAS, the Agreement governs compliance with Section 106 of the National Historic Preservation Act, as amended (54 USC § 306108), and its implementing regulations, 36 CFR part 800 (collectively, Section 106) for nine separate undertakings that are individual project sections (each, an Undertaking as defined in the Agreement, and collectively, the Undertakings) of the California High-Speed Rail (HSR) System (previously referred to in the Agreement as the California High-Speed Train System); and

WHEREAS, subsequent to the execution of the Agreement, the Authority separated the Palmdale to Los Angeles project section into two smaller project sections, Palmdale to Burbank and Burbank to Los Angeles, for the purposes of analysis under the National Environmental Policy Act (NEPA) and Section 106, and each of the smaller project sections are considered Undertakings under the Agreement; and

WHEREAS, consistent with Stipulation XVII.E of the Agreement, the FRA, the ACHP, SHPO, and the Authority have assessed the Agreement and determined it is effective and have decided to extend its duration, with appropriate revisions identified in this First Amendment to the Agreement (First Amendment); and

WHEREAS, on April 18, 2013, and June 13, 2013, the Surface Transportation Board (STB) determined that it has jurisdiction over the California HSR System under 49 USC § 10501(a)(2)(A) of the Interstate Commerce Act, as amended, and, on January 18, 2018, the STB requested that it be added as an invited signatory to the Agreement to fulfill its obligations under Section 106; and on June 23, 2021 the STB designated the Authority as lead Federal agency for Section 106; and

WHEREAS, the FRA, the ACHP, SHPO, and the Authority agreed to invite the STB to sign the Agreement as an invited signatory by executing this First Amendment; and

WHEREAS, the Surface Transportation Project Delivery Program, authorized by 23 USC § 327, allows the Secretary of Transportation, through the FRA, to assign, and the State of California to assume, the FRA's responsibilities for environmental review, consultation, and other actions required under Federal environmental laws, including Section 106, for railroad and multimodal projects; and

WHEREAS, the State of California requested that the FRA assign its responsibilities for compliance with NEPA and other Federal environmental laws, including Section 106, with respect to the implementation of the California HSR System; and

WHEREAS, on July 23, 2019, the State of California, acting through its California State Transportation Agency and the Authority, and the FRA entered into a Memorandum of Understanding (MOU) pursuant to which the FRA assigned, and the State of California assumed, FRA's responsibilities for environmental review, consultation, or other action required or arising under certain Federal environmental laws for certain railroad projects relating to the California HSR System; and

WHEREAS, the projects described in 3.3.1.A of the MOU include the Undertakings; and

WHEREAS, such assigned and assumed responsibilities include Section 106 except to the extent 23 CFR § 773.105(b)(4) requires the FRA to retain responsibility for government-to-government consultation with Indian tribes (referred to as Indian tribes in 36 CFR Part 800, 23 CFR § 773.105(b)(4) and the MOU, and as Native American tribes in the Agreement and the remainder of this First Amendment); and

WHEREAS, prior to July 23, 2019, and at the time the Agreement took effect, the FRA was responsible for compliance with Section 106 for the Undertakings; and

WHEREAS, consistent with Sections 3.4.1 and 6.1 of the MOU and 23 USC § 327(e), the Authority is deemed to be acting as the FRA for, and is solely responsible and solely liable for carrying out, compliance with Section 106 for the Undertakings; and

WHEREAS, pursuant to Section 5.1.1 of the MOU and 23 USC § 327(a)(2)(C), in assuming the FRA's responsibilities as set forth in the MOU, the Authority is subject to the same procedural and substantive requirements that apply to the FRA in carrying out the terms of the Agreement and other interagency agreements such as programmatic agreements, memoranda of understanding, memoranda of agreement, and other similar documents that relate to the environmental review process; and

WHEREAS, consistent with Section 5.3.2 of the MOU and 36 CFR § 800.2(a), the Authority has consulted with FRA, the ACHP, and SHPO to enter into this First Amendment to identify the Authority as the Agency Official responsible for ensuring that the Undertakings are implemented in compliance with Section 106, except to the extent 23 CFR § 773.105(b)(4) requires the FRA to retain responsibility for government-to-government consultation with Native American tribes; and

WHEREAS, the FRA requested, and the ACHP, SHPO, and the Authority agreed, to change the FRA's status under the Agreement from a signatory to an invited signatory; and

WHEREAS, the Authority will notify the public and consulting parties, including Native American tribes, following execution of this First Amendment;

NOW, THEREFORE, in accordance with Stipulation XVII.B of the Agreement, the FRA, the ACHP, SHPO, the STB, and the Authority agree to amend the Agreement as follows:

1. Add new Stipulation XVIII, Definitions, to the Agreement as follows:

A. The term signatory or Signatory (or, collectively, signatories or Signatories), as used in the Agreement (as amended by this First Amendment), means the ACHP, SHPO, and the Authority.

B. The term Invited Signatory (or, collectively, Invited Signatories), as used in the Agreement (as amended by this First Amendment), means the FRA and the STB.

2. Amend Stipulations II.A. and II.B. so they are both stricken in their entirety and replaced with the following:

> *"A. FRA*
> *FRA is responsible for government-to-government consultation with Native American tribes for the Undertakings as provided in Stipulation IV, Consultation with Federally-Recognized Native American Tribes and Non-Federally-Recognized Native American Groups.*
>
> *B. Authority*
> *The Authority is responsible for ensuring that the Undertakings are implemented in compliance with Section 106, except to the extent 23 CFR § 773.105(b)(4) requires the FRA to retain responsibility for government-to-government consultation with Native American tribes. The Authority has primary responsibility pursuant to 36 CFR 800.2(a)(2) to ensure that the provisions of this Agreement are carried out. The Authority will execute MOAs for each of the Undertaking sections and participate in the resolution of disputes. The Authority is responsible for all determinations of eligibility and effect of the undertakings. Consistent with the requirements of 36 CFR 800.2(a) and 800.2(c)(4), the Authority is legally responsible for ensuring that the terms of this Agreement are carried out and for all findings and determinations made pursuant to this Agreement.*

3. Amend all references to "FRA" in the Agreement's Stipulations so that "FRA" is stricken and replaced with "Authority," except for Stipulation V.A. and Stipulation XVI and except as otherwise provided in this First Amendment.

4. Amend the third sentence of Stipulation VI.B.1 of the Agreement so it is stricken in its entirety and replaced with the following:

> "*Findings shall be made by the Authority based on National Register of Historic Places (NRHP) criteria (36 CFR 60.4) and evaluated in accordance with provisions of 36 CFR §800.4(c).*"

5. Amend the first sentence of Stipulation VI.C.1 of the Agreement so it is stricken in its entirety and replaced with the following:

> "*The Authority will submit a Draft HPSR to the Signatories, STB, and identified consulting parties, including Native American tribes, upon request prior to the public circulation of the draft environmental impact statement (DEIS) for each Undertaking, and such Draft HPSR will include documentation of all properties in the APE that are listed in the NRHP, were previously determined eligible for the NRHP, were found eligible for the NRHP by QIs, or appear ineligible for the NRHP but meet one of the conditions in Stipulation VI.B.4.*"

6. Amend the first sentence of Stipulation VI.C.4 of the Agreement so it is stricken in its entirety and replaced with the following:

> "*If, after the submission of the Final HPSR, there are changes to the APE that includes additional properties not exempt from evaluation or information is received that there may be additional historic properties within the APE, the Authority will prepare a*

Supplemental HPSR and distribute it to the SHPO and all parties who received the Final HPSR for a review and comment period of 30 days."

7. Amend the last paragraph of Stipulation VI.D of the Agreement so it is stricken in its entirety and replaced with the following:

"*Should a member of the public disagree with any NRHP eligibility determinations, the Authority shall immediately inform the other Signatories and STB in writing and take the objection into account. The Authority shall consult with the objecting party and, if the objecting party so requests, with any or all of the other Signatories for no more than 30 days. The Authority shall document such consultation efforts. Within 14 days following closure of the consulting period, the Authority shall render a decision regarding the objection and notify all parties of this decision in writing. In reaching the decision, the Authority shall take comments from all parties into account and make a good faith effort to resolve the dispute. The Authority's decision regarding resolution of the objection from a member of the public will be final.*"

8. Amend Stipulation VII.A of the Agreement so it is stricken in its entirety and replaced with the following:

"*A. If historic properties are identified within an Undertaking, the Authority shall assess adverse effects in accordance with 36 CFR 800.5 and prepare a Findings of Effect report (FOE) for each Undertaking where historic properties were identified within the APE. The FOE shall describe the assessment of potential adverse effects to historic properties that would result from the construction or operation of the project, and identify mitigation measures that would eliminate or minimize effects to be incorporated into the design and construction documents of the Undertaking. The Authority shall distribute the FOEs to the Signatories, STB, and other consulting parties, including Native American tribes, identified as a result of Stipulations IV.C and V.B, who shall have a 30-day review and comment period. The Authority shall ensure that comments are considered prior to finalizing the FOE(s) for submission to the SHPO for final review and concurrence. The SHPO shall have an additional 30 days for review and concurrence with the final FOE(s).*"

9. Amend Stipulation XI.A of the Agreement so it is stricken in its entirety and replaced with the following:

"*A. The Authority shall ensure that all operations for the portion of the Undertaking with the potential to affect an historic property are immediately ceased upon unanticipated resource discovery.*"

10. Amend the first sentence of Stipulation XI.B of the Agreement so it is stricken in its entirety and replaced with the following:

"*The Authority shall make a determination of the NRHP eligibility of the historic property and the potential for the Undertaking to adversely affect the resource.*"

11. Amend the first sentence of Stipulation XI.D of the Agreement so it is stricken in its entirety and replaced with the following:

"*The Authority shall implement the avoidance, minimization, or treatment plan and advise the other Signatories and STB of the satisfactory completion of the approved work.*"

12. Amend Stipulation IV of the Agreement so it is stricken in its entirety and replaced with the following:

"*IV. CONSULTATION WITH FEDERALLY-RECOGNIZED NATIVE AMERICAN TRIBES AND NON-FEDERALLY-RECOGNIZED NATIVE AMERICAN GROUPS*

A. FRA

1. Consistent with 23 CFR 773.105(b)(4) and Sections 3.2.1 and 3.2.4 of the MOU, the FRA is responsible for conducting government-to-government consultation with Federally-recognized Native American tribes for the Undertakings.

2. Notwithstanding any other provision of this Agreement, the FRA shall honor the request of any Federally-recognized Native American tribe for government-to-government consultation regarding an Undertaking covered by this Agreement. If a request for government-to-government consultation comes to the Authority, the Authority shall promptly inform the FRA. If any Federally-recognized Native American tribe requests government-to-government consultation with the FRA, the FRA shall conduct the government-to-government consultation and, if the tribe agrees, involve the Authority in that consultation process.

B. The Authority

1. The Authority shall consult with Federally-recognized Native American tribes as described in this Stipulation IV. The Authority is responsible for consultation with non-Federally-recognized Native American groups.

2. The Authority shall ensure that consultation with Federally-recognized Native American tribes and non-Federally-recognized Native American groups is initiated early in the project development process for each Undertaking to identify cultural, confidentiality, or other concerns, including concerns about historic properties, and to allow adequate time for consideration of such concerns whenever they may be expressed.

3. The Authority shall ensure that on-going consultation with Federally-recognized Native American tribes and non-Federally-recognized Native American groups continues throughout the Section 106 compliance process and whenever such groups express a concern about the Undertaking or about historic properties that may be affected by an Undertaking.

4. In accordance with 36 CFR §§ 800.2(c)(2) and 800.2(c)(5), respectively, Federally-recognized Native American tribes and non-Federally-recognized Native American groups may be identified as consulting parties in subsequent memoranda of agreement (MOAs) that are prepared for an Undertaking covered by this Agreement as described further in Stipulation VIII.A.

C. Consultation for Each Undertaking

1. The Authority shall identify Federally-recognized Native American tribes and non-Federally-recognized Native American groups who will participate in the Undertaking as a consulting party and shall consider future written requests to participate as consulting parties in an Undertaking.

2. *The Authority shall hold informal informational meetings with both Federally-recognized Native American tribes and non-Federally-recognized Native American groups specific to each Undertaking to help provide project updates and to identify potential consulting parties for an MOA.*
3. *The Authority shall consult with Federally-recognized Native American tribes and non-Federally-recognized Native American groups identified as consulting parties that attach religious and cultural significance to historic properties that may be affected by an Undertaking at key milestones in the Section 106 and NEPA processes to gain input from tribal governments. The Native American consultation will follow a process depicted in Attachment E and includes the following Native American consultation points:*
    (i) *During identification of historic properties, to confirm the historic properties identified.*
    (ii) *During assessment of adverse effects, (a) to provide requested site records of historic properties adversely affected for review, (b) to determine when and where tribal monitors may be needed during ground disturbing activities in previously identified sensitive areas or known sites, and (c) to develop avoidance, minimization and treatment measures for adverse effects to both archaeological and built resources.*
    (iii) *During resolution of adverse effects, (a) to develop and finalize treatment plans for archaeological and built resources, (b) to develop and execute MOAs, and (c) to determine when and where tribal monitors may be needed during treatment plan implementation or construction.*
    (iv) *During treatment plan and MOA implementation, (a) to provide for tribal monitors where agreed upon, (b) to review and comment on the Programmatic Agreement annual report, including input on treatment plan and MOA implementation.*
4. *Consultation with Federally-recognized Native American tribes shall continue throughout the development of subsequent Undertakings regardless of whether such tribes have chosen to concur with this Agreement.*"

13. Amend Stipulation XVII of the Agreement in its entirety so it is stricken and replaced with the following:

"*XVII. ADMINISTRATIVE STIPULATIONS*

A. Dispute Resolution

1. *Should any Signatory or Invited Signatory to this Agreement object within 30 days to any action proposed or any document provided for review pursuant to this Agreement, the Authority shall consult with the objecting party to resolve the objection. If the Authority determines that the objection cannot be resolved within 15 days, the Authority shall forward all documentation relevant to the dispute, including the Authority's proposed resolution, to the ACHP. The Authority will also provide a copy to all Signatories, Invited Signatories, and consulting parties for the Undertaking. The ACHP shall provide the Authority with its advice on the resolution of the objection within 30 days of receiving adequate documentation. Prior to reaching a final decision on the dispute, the Authority shall prepare a written response that takes into account any timely advice or comments regarding the dispute from the Signatories, Invited Signatories, and consulting parties, including Native American tribes, and provide them with a copy of this written response. The Authority will then*

proceed according to its final decision. If the ACHP does not provide its advice regarding the dispute within 30 days, the Authority may make a final decision on the dispute and proceed accordingly. Prior to reaching such a final decision, the Authority shall prepare a written response that takes into account any timely comments regarding the dispute from the Signatories, Invited Signatories, and consulting parties for the Undertaking, and provide them and the ACHP with a copy of such written response.

2. *Should a consulting party or member of the public disagree with findings made pursuant to this Agreement, the Authority shall immediately inform the Signatories and Invited Signatories in writing and take the objection into account. The Authority shall consult with the objecting party and, if the objecting party so requests, with any or all of the other Signatories and Invited Signatories for no more than 30 days. Within 14 days following closure of the consulting period, the Authority shall render a decision regarding the objection and notify all parties of this decision in writing. In reaching the decision, the Authority shall take comments from all parties into account. The Authority's decision regarding resolution of the objection will be final.*
3. *The Authority's responsibility to carry out all other actions under this Agreement that are not subject to dispute will remain unchanged.*

B. Amendment

1. *The Signatories and Invited Signatories to this Agreement may request that it be amended, whereupon the Signatories and Invited Signatories will consult to consider such amendment. This Agreement, including any attachment to this Agreement, may be amended only upon written concurrence of all Signatories and Invited Signatories.*
2. *To address minor changes in an Undertaking or the treatment of historic properties affected by an Undertaking, the Authority may propose revisions to the treatment plans rather than to this Agreement. Upon the written concurrence of the Signatories, the Authority may revise the treatment plans to incorporate the agreed-upon changes without executing a formal amendment to this Agreement.*
3. *Revisions to an attachment to this Agreement would be implemented through consultation and include any necessary revisions to the Agreement itself that may result from modification of an attachment*

C. Review and Reporting

1. *The Signatories, Invited Signatories, and consulting parties, including Native American tribes, may review activities carried out by the Authority pursuant to this Agreement. The Authority shall facilitate this review by compiling specific categories of information to document the effectiveness of this Agreement and by making this information available in the form of a written annual Programmatic Agreement report. Categories of information shall include, but are not limited to, a summary of actions taken under this Agreement, including all findings and determinations, public objections, and inadvertent effects or foreclosures. The range and type of information included by the Authority in the written report and the manner in which this information is organized and presented must be such that it facilitates the ability of the reviewing parties to assess accurately the degree to which the Agreement and its manner of implementation constitute an efficient and effective program under 36 CFR Part 800.*

2. *The Authority shall prepare the written report of these findings annually following execution of this Agreement. The Authority shall submit the annual reports to the Signatories and Invited Signatories no later than three (3) months following the end of the State fiscal year until all treatment is completed. There will be a 30-day period to review and comment on the report. The Annual Programmatic Agreement Report will be finalized within 30 days of receipt of comments.*
3. *The Authority shall make the annual report available for public inspection. The Authority shall send copies of the report to the Signatories, Invited Signatories, and consulting parties, including Native American tribes, of this Agreement and any subsequent MOAs, and make a copy available to members of the public for comment, upon request.*
4. *In conjunction with the review of the annual reports prepared by the Authority, the Signatories and Invited Signatories shall consult in an annual teleconference to review the overall effectiveness and benefits of this Agreement, determine if its requirements are being met, decide if amendments to the Agreement are warranted, review the reporting format and categories for adequacy, and identify any other actions that may be needed in order to take into account the effects of the Undertakings on historic properties in California.*

D. Termination

Any Signatory or Invited Signatory may terminate this Agreement by providing 30 days written notice to the other Signatories and Invited Signatories. The Signatories and Invited Signatories shall consult during the 30-day period prior to termination to seek agreement on amendments or other actions that would avoid termination. Should such consultation result in an agreement on an alternative to termination, the Signatories and Invited Signatories shall proceed in accordance with that agreement. Should a Signatory or Invited Signatory propose termination of this Agreement, it will notify the other Signatories and Invited Signatories in writing. If any of the Signatories or Invited Signatories individually terminates its participation in the Agreement, then the Agreement is terminated in its entirety. In the event of termination, then the Authority shall either consult in accordance with 36 CFR 800.14(b) to develop a new programmatic agreement or request the comments of the ACHP pursuant to 36 CFR 800. Beginning with the date of termination, the Authority shall ensure that until and unless a new Agreement is executed for the actions covered by this Agreement, the Undertakings shall be reviewed individually in accordance with 36 CFR 800.4–800.6.

E. Duration of this Agreement

This Agreement shall remain in effect until expiration or termination of the MOU. If the MOU is renewed beyond July 23, 2024, this Agreement shall be amended accordingly. If the Agreement is effective and its duration needs to be extended, the signatories can decide to extend the duration of the Agreement. If this Agreement expires, the Authority shall notify the Signatories and Invited Signatories in writing. If the Authority or a Federal agency party to this Agreement chooses to continue with the Undertaking after this Agreement expires, it shall review the Undertaking in accordance with 36 CFR Part 800.

F. Execution and Implementation of the Agreement

1. *This Agreement, including its attachments, shall take effect upon execution by all the Signatories. Additional amendments to this Agreement shall take effect upon execution by all the Signatories and Invited Signatories.*

2. *Execution of this Agreement by the Signatories and implementation of its terms evidence that the Authority has taken into account the effects of the Undertakings on historic properties and afforded the ACHP an opportunity to comment.*"

14. Effect of Agreement. All provisions of the Agreement that are not amended by this First Amendment remain in effect.

15. Effective Date. This First Amendment shall take effect upon execution by the ACHP, SHPO, and the Authority.

FIRST AMENDMENT TO THE PROGRAMMATIC AGREEMENT AMONG THE FEDERAL RAILROAD ADMINISTRATION, THE ADVISORY COUNCIL ON HISTORIC PRESERVATION, THE CALIFORNIA STATE HISTORIC PRESERVATION OFFICER, AND THE CALIFORNIA HIGH-SPEED RAIL AUTHORITY REGARDING COMPLIANCE WITH SECTION 106 OF THE NATIONAL HISTORIC PRESERVATION ACT, AS IT PERTAINS TO THE CALIFORNIA HIGH-SPEED TRAIN PROJECT

PROGRAMMATIC AGREEMENT AMONG
THE FEDERAL RAILROAD ADMINSTRATION,
THE ADVISORY COUNCIL ON HISTORIC PRESERVATION,
THE CALIFORNIA STATE HISTORIC PRESERVATION OFFICER, AND
THE CALIFORNIA HIGH-SPEED RAIL AUTHORITY
REGARDING
COMPLIANCE WITH SECTION 106 OF THE NATIONAL HISTORIC PRESERVATION ACT,
AS IT PERTAINS TO THE CALIFORNIA HIGH-SPEED TRAIN PROJECT

WHEREAS, The California High Speed Rail Authority (Authority), an agency of the State of California, proposes to construct and operate a Statewide High Speed Train (HST) System comprised of nine independent sections between major metropolitan areas of California. The following HST System sections (see map, Attachment A) comprise the nine separate undertakings covered by this Programmatic Agreement (hereafter, Agreement), which are subject to review under Section 106 of the National Historic Preservation Act and its implementing regulations, 36 Code of Federal Register (CFR) Part 800:

- San Francisco to San Jose.
- San Jose to Merced.
- Merced to Sacramento.
- Merced to Fresno.
- Fresno to Bakersfield.
- Bakersfield to Palmdale.
- Palmdale to Los Angeles.
- Los Angeles to Anaheim.
- Los Angeles to San Diego.

WHEREAS, in 2005 the Federal Railroad Administration (FRA), acting as the Federal agency, and the Authority completed a Statewide Program Environmental Impact Report/Environmental Impact Statement (EIR/EIS) in accordance with the requirements of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA) as the first phase of the tiered environmental review process. In 2008 the FRA and the Authority completed a second program EIR/EIS on the Central Valley to Bay Area portion of the HST System. The Record of Decision (ROD) for the Statewide Program EIR/EIS indicated that project-level environmental analysis would be conducted for sections of the Statewide HST System as the next phase of environmental review and project approval; and

WHERAS, pursuant to the requirements of CEQA and NEPA, the Authority and the FRA conducted a public and agency involvement program as part of the program environmental review process for the Statewide Program EIR/EIS. As part of this outreach, information was provided to 15,500 federal, state, and local agency representatives; elected officials; property owners; interested persons; and interested organizations. Approximately 25 informal and formal public meetings were held statewide during the Program EIR/EIS process. The Authority and the FRA convened staff representatives from 27 interested federal and state agencies to provide input on the environmental review process. Targeted interested groups included non-governmental organizations, community planning organizations, and public interest discussion/research groups; and

WHEREAS, for the Statewide Program EIR/EIS, the FRA and the Authority initiated consultation with Native American groups and sent letters providing information about the proposed project alternatives and requesting information about any traditional cultural properties that could be affected by the project. The FRA and Authority also contacted the California Native American Heritage Commission for a search of their Sacred Lands files and to provide a list of Native American tribes or groups for Section 106 consultation.

WHEREAS, in addition to consultation with the Federally-recognized Native American tribes, and other federal, state, regional, and local agencies, as appropriate, the FRA, as the Federal agency, and the Authority, as a responsible state agency, consulted with the Advisory Council on Historic Preservation (Council) and the State Historic Preservation Officer (SHPO) on the historic properties identified in the Program EIR/EIS and on measures to avoid, minimize, and mitigate potentially significant impacts; and

WHEREAS, the FRA has determined that each of the nine independent sections of the proposed HST System that include rail lines, associated structures, maintenance and ancillary facilities, construction easements, and staging areas, is an undertaking of this Agreement that may have an effect upon historic properties included on or eligible for inclusion on the National Register of Historic Places (NRHP); and

WHEREAS, the construction schedule is different for each undertaking, and Section 106 of the National Historic Preservation Act (16 U.S.C. §470f, hereafter Section 106) may be conducted and concluded at different times for each undertaking; and

WHEREAS, the purpose of this Agreement is to provide statewide consistency in consultation procedures, documentation standards, and federal agency oversight in compliance with Section 106 of the National Historic Preservation Act for each undertaking, each of which would be subject to an individualized consultation process under the terms of the PA; and

WHEREAS, the Authority has received a grant from the FRA though the High-Speed Intercity Passenger Rail Program funded in part through the American Recovery and Reinvestment Act (ARRA), to construct a section of the California High-Speed Train consisting of portions of the Merced to Fresno and Fresno to Bakersfield undertakings, and this Agreement streamlines the Section 106 compliance process, thereby expediting the obligation of ARRA funds; and

WHEREAS, the FRA has a statutory obligation, as the federal agency, to fulfill the requirements of Section 106 (36 CFR 800). The FRA, in consultation and cooperation with the Authority, shall ensure that the measures in the following stipulations are carried out. The FRA authorizes the Authority to initiate consultation with the SHPO pursuant to 36 CFR 800.14(b)(1)(iii) for the undertakings covered by this Agreement; and

WHEREAS, pursuant to 36 CFR 800.14, the FRA delegates major decision-making responsibility to the Authority including identification of historic resources, findings of eligibility, findings of effect, consultation, and the development and implementation of individual Memoranda of Agreement (MOAs) and treatment plans for each undertaking. The Authority will submit documents specified in this Agreement to the SHPO on behalf of the FRA: and

WHEREAS, the FRA and the Authority will jointly prepare environmental studies of the HST Projects (undertakings) in accordance with NEPA, including cultural resource studies required for Section 106, to coordinate the NEPA and Section 106 processes to the maximum extent possible; and

WHEREAS, the FRA, the Council, the Authority, and the SHPO are signatories pursuant to 36 CFR 800.6(c)(1) and have authority to execute, amend, or terminate this Agreement; and

WHEREAS, the FRA and the authority will continue to consult with Federally recognized Native American Tribes, concerning properties of traditional religious and cultural significance, and the Pechanga and Soboba Band of Luiseno Indians have requested to be concurring tribes under this Agreement; and

WHEREAS, all of the signatories to this Agreement accede to implement the procedure and measures described herein for each undertaking in keeping with the following stipulations; and

NOW, THEREFORE, the signatories agree that the proposed undertakings covered by this Agreement shall be implemented in accordance with the following stipulations in order to consider the effect of each undertaking on historic properties and that these stipulations shall govern compliance of the proposed HST System with Section 106 of the NHPA until this Agreement expires or is terminated.

STIPULATIONS

I. APPLICABILITY

A. This Agreement shall apply to all the FRA and Authority undertakings administered under the HST Project for which the FRA is the Federal agency.

B. This Agreement shall not apply to undertakings that occur on or affect tribal lands as defined in Section 301(14) of the NHPA. While no use of tribal land is anticipated, if such undertakings occur, the FRA shall follow the procedures in 36 CFR Part 800.

C. In the event that the Authority applies for additional federal funding or approvals for the undertakings from another agency that is not party to this agreement and the undertakings as described herein remain unchanged, such funding or approving agency may comply with Section 106 by agreeing in writing to the terms of this Agreement and notifying and consulting with SHPO and Council. Any necessary modifications will be considered in accordance with Stipulation XVII.B of this Agreement.

II. ROLES AND RESPONSIBILITIES

A. FRA

As the Federal agency, the FRA has primary responsibility pursuant to 36 CFR 800.2(a)(2) to ensure that the provisions of this Agreement are carried out. The FRA will conduct government-to-government consultation with Federally-recognized Native American tribes, execute MOAs for each of the Undertaking sections, and participate in the resolution of disputes. The FRA is responsible for all determinations of eligibility and effect of the undertakings. Consistent with the requirements of 36 CFR 800.2(a) and 800.2(c)(4), the FRA remains legally responsible for ensuring that the terms of this Agreement are carried out and for all findings and determinations made pursuant to this Agreement.

B. Authority

The FRA has delegated to the Authority responsibility for the implementation of the following provisions of this Agreement: Consult with non-Federally-recognized Native American groups, other consulting parties and the public; conduct Section 106 reviews in a timely manner; delineate and change the APE as needed and inform signatories of the change; prepare documentation for the SHPO and the FRA including determinations of eligibility and effect; circulate comments from signatories; maintain documentation of the Section 106 compliance for each Undertaking; develop a prototype MOA for each Undertaking; invite local agencies, Native American groups, interested non-governmental organizations, and individuals to participate in the development of each Undertaking MOA to agree upon means to avoid, minimize, and/or mitigate adverse effects to historic properties; develop and implement MOAs for each Undertaking; develop a built-environment treatment plan and an archaeological treatment plan prototype to be used for each Undertaking; develop and implement the individual Undertaking treatment plans, as provisions in the MOAs for each Undertaking; and ensure project information is available to consulting parties and the public in concert with the CEQA/NEPA process for each undertaking.

C. SHPO

The SHPO shall be responsible for reviewing project documentation in a timely manner and participating in consultation as set forth in this PA.

D. Council

The Council shall be responsible for providing technical guidance, participating in dispute resolutions if needed, and monitoring the effectiveness of this Agreement.

III. PROFESSIONAL QUALIFICATIONS STANDARDS

All actions prescribed by this Agreement that involve the identification, evaluation, analysis, recording, treatment, monitoring, or disposition for historic properties, or that involve reporting or documentation of such actions in the form of reports, forms, or other records, shall be carried out by or under the direct supervision of a person or persons who meet, at a minimum, the Secretary of the Interior's Professional Qualifications Standards (48 FR 44738-44739) (Appendix A to 36 CFR Part 61) in the appropriate discipline. Hereinafter, such persons shall be referred to as Qualified Investigators (QIs). The Authority shall ensure that the work outlined in this Agreement is conducted by staff meeting these qualifications standards. However, nothing in this stipulation may be interpreted to preclude the FRA or the Authority or any agent or contractor thereof from using the services for persons who are not QIs, as long as their activities are overseen by QIs.

IV. ON-GOING CONSULTATION WITH NATIVE AMERICAN TRIBES

A. FRA

1. As the Federal agency with responsibility for Section 106 compliance, the FRA is responsible for all government to government consultation with federally-recognized tribes. A list of federally-recognized Native American tribes contacted can be found in Attachment (F).

2. The FRA initiated government-to-government consultation by letter to all Federally-recognized Native American tribes that could be affected by the undertakings. Tribal Representatives have also been contacted by telephone.

3. The FRA shall ensure that on-going consultation with Federally-recognized Native American tribes continues early in the project development process for each undertaking to identify cultural, confidentiality, or other concerns including those about historic properties, and to allow adequate time for consideration of such concerns whenever they may be expressed.

4. The FRA provided the draft Agreement to Federally-recognized Native American tribes for review and comment. Federally-recognized Native American tribes were provided a 30 calendar day opportunity to comment. All comments received by Federally-recognized Native American tribes were considered by the signatory parties and where appropriate incorporated herein.

5. In accordance with 36 CFR 800.2(c)(2), Federally-recognized Native American tribes may be identified as consulting parties for individual undertakings and in subsequent MOAs that are prepared for an undertaking covered by this Agreement as described further in Stipulation VIII.A.

6. Consultation with Federally-recognized Native American tribes shall continue throughout the development of subsequent undertakings regardless of whether such tribes have chosen to concur with this Agreement.

7. The FRA shall identify tribes who will participate in an undertaking as a consulting party and shall consider future written requests to participate as consulting parties in an undertaking.

B. The Authority

1. The Authority may consult informally with the federally recognized tribes and will coordinate such consultation with the FRA. The Authority is responsible for consultation with non-federal recognized Native American groups. A list of non-federally-recognized Native American groups contacted can be found in Attachment (F).

2. Authority shall ensure that consultation with non-Federally-recognized Native American groups, as appropriate, is initiated early in the project planning process for each undertaking to identify cultural, confidentiality, or other concerns and to allow adequate time for consideration of such concerns.

3. The Authority sent letters to all non-Federally-recognized Native American groups to begin consultation. Tribal Representatives have also been contacted by telephone.

4. The Authority shall ensure that consultation continues with non-federally–recognized Native American groups respectively throughout the Section 106 compliance process and whenever such groups express a concern about the undertaking or about historic properties that may be affected by an undertaking.

5. In accordance with 36 CFR 800.2(c)(2), non-Federally-recognized Native American groups may be identified as consulting parties in subsequent MOAs that are prepared for an undertaking covered by this Agreement as described further in Stipulation VIII.A.

6. The FRA and the Authority shall ensure that consultation continues with non-federally–recognized Native American groups respectively throughout the Section 106 compliance process and when such groups express a concern about an undertaking or about historic properties that may be affected by an undertaking.

7. The Authority provided the draft Agreement to non-Federally-recognized Native American groups. Native American groups were provided 30 calendar days to comment on the document.

C. Consultation for each Undertaking

1. The Authority shall hold informal informational meetings with both Federally-recognized Native American tribes and non-Federally-recognized Native American groups specific to each undertaking to help provide project updates and to identify potential consulting parties for an MOA.

2. The FRA shall consult on a government to government basis with Federally-recognized Native American tribes identified as consulting parties that attach religious and cultural significance to historic properties that may be affected by an undertaking at key milestones in the Section 106 and NEPA processes to gain input from Tribal governments. The Authority shall consult with all other involved Native American groups. The Tribal consultation will follow a process depicted in Attachment E and includes the following Native American consultation points:

   i. During identification of historic properties, to confirm the historic properties identified.

   ii. During assessment of adverse effects, (a) to provide requested Site Records of historic properties adversely affected for review, (b) to determine when and where tribal monitors may be needed during ground disturbing activities in previously identified sensitive areas or known sites, and (c)

to develop avoidance, minimization and treatment measures for adverse effects to both archaeological and built resources.

iii. During resolution of adverse effects, (a) to develop and finalize treatment plans for archaeology and built resources, (b) develop and execute MOAs, and (c) to determine when and where tribal monitors may be needed during treatment plan implementation or construction.

iv. During treatment plan and MOA implementation, (a) to provide for Tribal Monitors where agreed upon, (b) to review and comment on the Programmatic Agreement Annual Report, including input on the treatment plan and MOA implementation.

V. PARTICIPATION OF OTHER CONSULTING PARTIES AND THE PUBLIC

A. Public Involvement

Public involvement in planning and implementation of undertakings covered by this Agreement shall be governed by the FRA's and the Authority' environmental compliance procedures, as set forth by the Authority's environmental analysis methods, and any advice and guidance documents. Historic resources will be identified and effects will be disclosed to the extent allowable under 36 CFR 800.2(d)(1-2), 800.3(e), and 800.11(c)(1 and 3) and Stipulation XII of this Agreement. Consistent with Section 106, the public and consulting parties will have an opportunity to comment and have concerns taken into account on findings identified in Section 106 survey and effects documents via attendance at public meetings where they can submit comments on the information presented, as well as access the Section 106 documents via email requests to the Authority's web site. Project information and announcements are posted on the Authority's web site (www.cahighspeedrail.ca.gov). Public involvement and the release of information hereunder shall be consistent with 36 CFR 800.2(d)(1-2), 800.3(e), and 800.11(c)(1 and 3), the Freedom of Information Act, 49 CFR. part 7, and Section 6254.10 of the California Government Code.

The FRA and the Authority have contacted local groups and individuals known to have interests in historic properties regarding the identification of historic properties in each section. Public meetings specific to historic properties and the effects of the project and treatment of these properties will be held in communities within each section. These interest groups and interested individuals will be invited to comment on the treatments proposed and those with demonstrated interest in the project will be invited to participate as consulting parties to the individual section MOAs Public involvement and the release of information hereunder shall be consistent with 36 CFR 800.2(d)(1-2), 800.3(e), and 800.11(c)(1 and 3), the Freedom of Information Act, 49 CFR. part 7, and Section 6254.10 of the California Government Code.

B. Consulting Parties

Consulting parties shall participate in undertakings covered by this Agreement in accordance with 36 CFR 800.2(c)(3) through (5) and 800.3(f). Consulting parties may include other federal, state, regional, or local agencies that may have responsibilities for historic properties and may want to review reports and findings for an undertaking within their jurisdiction.

The Authority shall submit to the ACHP and SHPO a list of consulting parties for each undertaking and a summary of coordination efforts and comments received. The SHPO shall submit comments, including recommendations for additional parties to the Authority within 30 days. The Authority shall revise and update this information as necessary based on SHPO's comments, and re-submit them to SHPO as part of the reports to be prepared under Stipulation VI. The Authority and FRA shall also consider individuals' written requests to participate as consulting parties in the development of measures to avoid, minimize and mitigate adverse effects to historic properties. Pursuant to 36 CFR

800.11(e) through (g), views of the public will be included in documentation of project effects to historic properties and the individual section MOAs

VI. IDENTIFICATION AND EVALUATION OF HISTORIC PROPERTIES

A. Area of Potential Effects

The Area of Potential Effects (APE) for each undertaking will be determined by the Authority in accordance with the APE Delineation guidelines (Attachment B). As described in Attachment B, throughout the design process, the Authority will determine if revisions to an undertaking require modifications to the APE. If an APE requires revisions, the Authority is responsible for informing the signatories, consulting Federally-recognized Native American tribes, and other consulting parties within 15 days of identification of the needed changes.

B. Identification of Historic Properties

1. The signatories to this Agreement along with the concurring tribes agree that the Authority will identify historic properties and prepare documentation in accordance with Attachment C. As appropriate, these methods may be modified for undertaking-specific needs in consultation with the signatories and in accordance with QI review and current professional standards. Findings shall be made by the Authority to the FRA based on National Register of Historic Places (NRHP) criteria (36 CFR 60.4) and evaluated in accordance with provisions of 36 CFR §800.4(c). Evaluation methods and criteria shall be consistent with the Secretary of the Interior's Standards and Guidelines for Evaluation (48 Federal Register 44729-44738) (36 CFR §63) and shall be completed by QIs qualified in the appropriate discipline: archaeology, architectural history, or history.

2. Historic properties shall be identified to the extent possible within the APE for each of the nine undertakings that comprise the California HST System and will be documented in the Project EIR/EIS and the Historic Property Survey Report (HPSR) as described in Attachment C. The content, methodology, level of effort, and documentation requirements for the HPSR shall follow federal and state guidelines and instructions, and are provided in detail in Attachment C. The identification effort and ineligible properties shall be documented in separate technical reports for archaeological properties and historic architectural properties, the drafts of which will be submitted for review by the signatories and other consulting parties including tribal historic preservation officers (THPOs) and tribal representatives who have expressed an interest in the undertaking.

   i. Archaeological properties include prehistoric and historic archaeological sites, properties identified as per 800.4(a)(4), objects and districts. Evaluations shall be made by QIs fully qualified in the discipline of archaeology. Archaeological properties within the APE that are identified by QIs as historic properties or presumed to be historic properties shall be documented in the HPSR. Archaeological properties evaluated as ineligible for the NRHP by QIs shall be documented in Archaeological Survey Reports (ASR). The content, methodology, level of effort, and documentation requirements for the ASR are provided in detail in Attachment C. A list of archaeological resources exempt from evaluation is provided in Attachment D.

   ii. Historic architectural properties include historic buildings, structures, objects, sites, landscapes and districts. Evaluations shall be made by QIs. Historic architectural properties within the APE that are identified by QIs as historic properties shall be documented in the HPSR. Historic architectural properties evaluated as ineligible for the NRHP by QIs shall be documented in Historic Architectural Survey Reports (HASR). The content, methodology, level of effort, and documentation requirements for the HASR are provided in detail in Attachment C. A list of historic architectural property types exempt from evaluation is provided in Attachment D.

3. Other categories of properties that do not warrant evaluation, including those that are minor, fragmentary, or do not meet age or integrity requirements, are exempt from evaluation in the HPSR, ASR, or HASR, and are identified in Attachment D.

4. A property less than 50 years old with potential exceptional significance or a property greater than 50 years old with characteristics indicating potential eligibility for the NRHP that is determined by a QI as ineligible for the NRHP that is not among the exempt property types identified in Attachment D shall be evaluated and documented in the HPSR if it meets one of the following conditions:

   i. The property was identified as significant in a state, regional, or local survey of historic properties.

   ii. The property was designated under a state, regional, or local ordinance with criteria for evaluating properties with historic or architectural significance.

   iii. The property was identified by the SHPO, THPO, or any party identified as a result of Stipulations IV and V.

   iv. The property would be acquired, destroyed, demolished, or substantially altered as a result of the undertaking.

C. Evaluation of Historic Properties

1. Upon review and concurrence of the findings by the FRA, a Draft HPSR would be submitted by the Authority to the signatories and identified consulting parties, including Native American tribes, upon request prior to the public circulation of each project DEIS, and would include documentation of all properties in the APE that are listed in the NRHP, previously determined eligible for the NRHP, found eligible for the NRHP by QIs, or that appear ineligible for the NRHP but meet one of the conditions in B.4. of this stipulation. Known archaeological properties that cannot be evaluated prior to approval of an undertaking will be presumed NRHP eligible. Where archaeological testing to determine NRHP eligibility is feasible, project-specific MOAs may include a provision for treatment plans that include archaeological testing or use of a combined archaeological testing and data recovery program.

2. The Authority shall submit its findings in the HPSR to the signatories and consulting parties, including Native American tribes, identified as a result of Stipulations IV.C and V.B, who shall have 30-days to review the HPSR findings and provide their recommendations for changes to the findings based on National Register criteria. If no objection is made, consistent with Stipulation VI.D, within the 30-day period, the findings for those historic properties would become final.

3. Other non-eligible properties not already reported in the HPSR within the APE will be evaluated by QIs, documented for each undertaking in an ASR and/or HASR, and submitted to the SHPO for review and concurrence at the same time as the HPSR or no later than the end of the comment period of the DEIS. If the SHPO, agency reviewer, consulting Native American tribe, or other consulting party asks for additional information or a re-evaluation of a property, that property and the updated finding of eligibility or non-eligibility shall be included in the Final HPSR. Comments received from the SHPO, the THPO, agency reviewer(s), consulting Native American Tribe(s), and other consulting parties will be considered and may be incorporated into a Final HPSR.

4 If, after the submission of the Final HPSR, there are changes to the APE that includes additional properties not exempt from evaluation or information is received that there may be additional historic properties within the APE, a Supplemental HPSR will be prepared, and distributed following review by the FRA, to the SHPO and all parties who received the Final HPSR for a review and comment period of 30 days. If no objection is made, consistent with Stipulation VI.D, within the 30-day period, the findings for those historic properties in the Supplemental HPSR would become final.

D. Eligibility Disagreements

Should a disagreement arise regarding the NRHP eligibility of a property in the APE for an undertaking, the FRA shall forward a Determination of Eligibility documentation to the Keeper of the National Register (Keeper) for resolution in accordance with 36 CFR 800.4(c)(2) if:

1. The SHPO or a federal agency with jurisdiction over the involved lands objects in writing within 30 days to a finding of eligibility, or

2. A Native American tribe or group that ascribes traditional religious and cultural significance to a property objects in writing within 30 days to a Finding of Eligibility regarding that property; and

3. The FRA is not able to resolve that objection through consultation with the SHPO and the objecting party as provided for in Stipulation XVII.A.

Should a member of the public disagree with any NRHP eligibility determinations, the Authority shall immediately inform the other signatories in writing and take the objection into account. The Authority shall consult with the objecting party and, if the objecting party so requests, with any or all of the other signatories for no more than 30 days. The Authority shall document such consultation efforts and submit the findings to the FRA for review. Within 14 days following closure of the consulting period, the FRA shall render a decision regarding the objection and notify all parties of this decision in writing. In reaching the decision, the FRA shall take comments from all parties into account and make a good faith effort to resolve the dispute. The FRA's decision regarding resolution of the objection from a member of the public will be final.

E. Phased Identification

In accordance with 36 CFR 800.4(b)(2), phased identification may occur in situations where identification of historic properties cannot be completed. In these cases, subsequent MOAs will provide a provision for the development and implementation of a post-review identification and evaluation effort as applicable to the undertaking.

VII. ASSESSMENT OF ADVERSE EFFECTS

A. If historic properties are identified within an undertaking, the Authority shall assess adverse effects in accordance with 36 CFR 800.5 and distribute a Findings of Effect report (FOE) to the FRA for review, for each undertaking where historic properties were identified within the APE. The FOE shall describe the assessment of potential adverse effects to historic properties that would result from the construction or operation of the project, and identify mitigation measures that would eliminate or minimize effects to be incorporated into the design and construction documents of the undertaking. Following the FRA review and concurrence, the Authority shall distribute the FOEs to the signatories, and other consulting parties, including Native American tribes, identified as a result of Stipulations IV.C and V.B, who shall have a 30-day review and comment period. The Authority shall ensure that comments are considered prior to finalizing the FOE(s) for submission to the SHPO for final review and concurrence. The SHPO shall have an additional 30 days for review and concurrence with the final FOE(s).

B. FRA will notify and invite the Secretary of the Interior (represented by the National Park Service regional office's program coordinator) when any project section may adversely affect a National Historic Landmark (NHL) pursuant to 36 CFR 800.10 and Section 110(f) of the NHPA.

C. Consistent with 36 C.F.R. § 800.5(b) and (d)(1), the FRA may determine that there is no adverse effect on historic properties within the APE for an undertaking when the effects of the undertaking would not meet the Criteria of Adverse Effect at 36 CFR 800.5(a)(1), the undertaking is modified to avoid adverse effects, or if conditions agreed upon by SHPO are imposed, such as subsequent review of plans for rehabilitation by the SHPO/THPO to ensure consistency with the Secretary's Standards for the Treatment of Historic Properties (36 CFR Part 68) and applicable guidelines, to avoid adverse effects. Any conditions would be included in the DEIS or Final EIS (FEIS).

VIII. TREATMENT OF HISTORIC PROPERTIES

A. Memoranda of Agreement

1. A MOA will be developed by the Authority for each undertaking where the FRA determines there would be an adverse effect to historic properties or when phased identification is necessary and adverse effects would occur.

2. Each MOA will include avoidance, minimization, and protective measures for eligible properties identified in the HPSRs such as preservation-in-place; processes for addressing project design changes or refinements after the HPSRs, FOEs and project EISs are completed, incomplete identification of buried resources, and unanticipated discoveries.

3. The FRA will notify the Council of any findings of adverse effect and invite the Council to participate in the development of the MOAs pursuant to 36 CFR 800.6(a)(1)(i)(c) as appropriate.

4. Should Native American tribes or groups decline to participate as signatories to an MOA, they will not be provided documentation regarding treatment that is called for in this Agreement or in subsequent MOAs unless they expressly request such information. Native American tribes and groups will continue to receive information on the undertakings as part of the NEPA process and may request to consult on an undertaking, or request additional coordination with the Authority or the FRA.

5. Pursuant to 36 CFR 800.11(e) through (g), views of the public will be considered and included where appropriate in individual section MOAs.

6. Upon review, concurrence, and execution of the MOA, Section 106 will be considered concluded for that undertaking.

B. Treatment Plans

1. Prototype treatment plans will be developed by the Authority. Two treatment plans will be developed by the Authority for each undertaking: a Built Environment Treatment Plan and an Archaeological Treatment Plan.

   i. The Built Environment Treatment Plan (BETP) will provide detailed descriptions of treatment measures for eligible buildings, structures, objects, landscapes and districts that will be affected by the undertaking. The BETP will also include descriptions of measures to be taken to protect historic properties and to avoid further adverse effects to historic properties.

   ii. The Archaeological Treatment Plan (ATP) will provide detailed descriptions of protection measures for archaeological resources and resources of importance to Federally Recognized Native American Tribes or Native American groups because of cultural affinity. The ATP could include but is not limited to the establishment of environmentally sensitive areas (ESAs), use of preconstruction archaeological excavation, preservation-in-place, avoidance, minimization, monitoring during construction where appropriate, procedures to be followed when unanticipated

discoveries are encountered, processes for evaluation and data recovery of discoveries, responsibilities and coordination with Federally Recognized Native American Tribes, Native American groups, NAGPRA compliance, and curation of recovered materials.

2. Each treatment plan will address historic properties adversely affected and set forth means to avoid, protect, or develop treatment measures to minimize the undertaking's effects where the Authority, in consultation with the appropriate agencies, the SHPO, and other MOA signatories, determines that adverse effects cannot be avoided. The Treatment Plans will conform to the principles of the Council's Treatment of Archaeological Properties: A Handbook Parts I and II, the "Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation" (Federal Register, Vol. 48, September 29, 1983, pp. 44716–44742) and appropriate SHPO Guidelines. The Authority will take into consideration the concerns of the consulting parties in determining the measures to be implemented.

3. Each treatment plan will include, but not be limited to; the content outlined in Attachment C for treatment plans. The consultative procedure through which a treatment plan is developed will address the adverse effect of any undertaking on historic properties and indicate that the treatment plan will be incorporated into an MOA.

C. Treatment Plan Reviews

1. Signatory Review

The Authority shall provide the treatment plans to the MOA signatories and MOA concurring parties for a 30-day review and comment period. Based on comments received, treatment plans will be revised and resubmitted for a final 30-day review. If the MOA signatories and/or MOA concurring parties fail to comment within 30-days of receiving the treatment plan, the Authority shall confirm with the MOA signatories and/or MOA concurring parties that no comments will be made and may then proceed with the undertaking. Treatment plans can be amended by the Authority without amending the MOAs. Disputes will be resolved in accordance with the Dispute Resolution clause in Stipulation XVII.A.

2. Public Participation

The Authority shall take reasonable steps to provide opportunities for members of the public to express their views on the Treatment Plans. Opportunities for public input may include the distribution of treatment plans consistent with 36 CFR 800.2(d)(1-2), 800.3(e), and 800.11(c)(1 and 3). Where appropriate, the Authority will hold informational meetings with the public to explain the treatment plans and obtain comment. Any public comments received will be considered and incorporated into the treatment plans as appropriate.

D. Treatment Plan Implementation

1. Upon execution of each MOA and prior to the commencement of construction activities, each related treatment plan will be implemented. Depending upon the nature of the treatment, the treatment may not be completed until after the undertaking is completed. Termination of the project after initiation of the treatment plans will require completion of any work in progress, and amendment of each treatment plan as described below. Amendments to the treatment plans will be incorporated by written agreement among the signatories to the MOA. Each MOA will outline appropriate reporting processes for the treatment plans.

2. Dispute Resolution

The parties participating in the development and implementation of the Treatment Plans will come to agreement on the treatment prescribed in and the implementation of the Treatment Plan in the MOA. If the parties are unable to come to agreement on the treatment of adverse effects in the MOA, the procedures outlined in XVII.A will be followed to resolve the dispute.

IX. CHANGES IN ANCILLARY AREA/CONSTRUCTION RIGHT-OF-WAY

The Authority will notify the MOA signatories and consulting parties of changes in the size or location of ancillary areas or the construction right-of-way that result in changes to the APE, or effects to historic properties (see Attachment B) as appropriate by undertaking. If any changes result in the use of unsurveyed areas, the Authority will ensure that these areas are subject to survey in order to locate any potentially significant cultural resources and that those resources are evaluated for NRHP eligibility. The Authority will consult with the MOA signatories and consulting parties regarding any newly identified historic properties that cannot be avoided. Protective and/or mitigation measures will be developed and the treatment plans will be amended and implemented in accordance with Stipulation VIII. All such changes will be documented in the annual Programmatic Agreement report.

X. CONSTRUCTION APPROVAL

Upon the completion of the pre-construction activities prescribed in the treatment plans, the Authority may authorize construction within portions of the APE after conclusion of treatment plan implementation where adverse impacts would occur and in accordance with the provisions of the applicable MOA, or where no historic properties were identified. If concurrence of the approval to proceed cannot be reached among the signatories, the dispute will be resolved in accordance with Stipulation XVII.A.

XI. DISCOVERIES, UNANTICIPATED ADVERSE EFFECTS, UNANTICIPATED DAMAGE

In accordance with 36 CFR 800.13(a)(2), the Authority will ensure that treatment plans prepared prior to implementation of the undertaking include measures to be completed in the event of a discovery or unanticipated adverse effect or damage. If a previously undiscovered archaeological, historical, or cultural property is encountered during construction, or previously known properties will be affected or have been affected in an unanticipated adverse manner, all activity will cease within 50 feet of the property to avoid or minimize harm to the property until the Authority in consultation with the MOA signatories can determine the resource's eligibility, identify the effects, determine if adverse effects can be avoided by alteration of construction methods or the installation of protective measures, and, if not mitigate impacts to the new discoveries or newly affected properties in accordance with the stipulations of project-specific MOAs and treatment plans.

At a minimum, the treatment plan developed for each undertaking as part of the development of each MOA will outline the process to be followed if historic properties are discovered or there are unanticipated effects on historic properties located within a project's APE after the undertaking has been initiated. The Authority will implement the following procedures:

A. The Authority shall ensure that all operations for the portion of the undertaking with the potential to affect an historic property are immediately ceased and will contact the FRA upon unanticipated resource discovery;

B. The Authority shall make a preliminary determination of the National Register eligibility of the historic property and the potential for the undertaking to adversely affect the resource and shall forward that finding to FRA who will make the final eligibility determination. If adverse effects to the resource can be avoided, no consultation with MOA signatories and consulting parties is necessary. If adverse effects cannot be avoided, the Authority will consult with the MOA signatories and propose treatment measures to minimize the effects.

C. The Authority shall notify Federally-recognized Native American tribes of any discoveries that have the potential to adversely affect properties of religious or cultural significance to them within 24 hours of the discovery. After reviewing such discoveries, the Native American tribes can request further consultation on the project by notifying the Authority, in writing or other documented means within 48 hours, as feasible. For interested Native American groups that are not Federally-recognized, the Authority shall notify them of any discoveries that have the potential to adversely affect properties of religious or cultural significance to them within 24 hours of the discovery. After reviewing such discoveries, such interested Native American groups can request further consultation on the project by notifying the Authority in writing within 48 hours, as feasible; and

D. The Authority shall implement the avoidance, minimization, or treatment plan and advise the FRA and other signatories of the satisfactory completion of the approved work. Once the approved work is completed, the activities that were halted to address the discovery situation may resume; and

E. Any treatment to damaged properties will follow the Secretary of the Interior's Standards for the treatment of historic properties. If the Authority determines damaged property should be repaired after construction is completed, then stabilization measures that will prevent and not cause further damage will be installed; and

F. If a National Historic Landmark is affected, the Authority shall include the Secretary of the Interior represented by the National Park Service regional office's program coordinator) and the Council in the notification process.

XII. CONFIDENTIALITY

All parties to this Agreement shall ensure that shared data, including data concerning the precise location and nature of historic properties and properties of religious and cultural significance are protected from public disclosure to the greatest extent permitted by law, including conformance to Section 304 of the NHPA, as amended and Section 9 of the Archaeological Resource Protection Act and Executive Order on Sacred Sites 13007 FR 61-104 dated May 24, 1996.

XIII. HUMAN REMAINS

A. Notification and Treatment

1. If human remains are inadvertently discovered during construction activities, all construction will cease within 100 feet in all directions of human remains and the Authority will immediately notify the appropriate parties in accordance with the project specific Treatment Plan. Human remains and grave goods will be treated in accordance with the Treatment Plan.

2. Federal agencies party to this Agreement will be responsible for curation of all records and other archaeological items resulting from identification and data recovery efforts on Federal lands within the agency's jurisdiction. This includes ensuring that the disposition of any human remains and associated funerary objects of Native American origin encountered on federal land during any action subject to this Agreement complies with § 3(c)(d) of the Native American Graves Protection and Repatriation Act and its implementing regulations codified at 43 CFR Part 10.

3. Any human remains and funerary objects discovered on non-federal land during the implementation of the terms of this Agreement and during the implementation of the undertaking itself will be treated by the Authority, in accordance with the requirements of § 7050.5(b) of the California Health and Safety Code. If, pursuant to § 7050.5(c) of the California Health and Safety Code, the county coroner/medical examiner determines that the human remains are or may be of Native American

origin, the discovery shall be treated in accordance with the provisions of §§ 5097.98 (a) - (d) of the California Public Resources Code. The Authority will ensure that to the extent permitted by applicable law and regulation, the views of the Most Likely Descendant(s) are taken into consideration when the Authority makes decisions about the disposition of Native American human remains and funerary objects, and will further ensure the respectful treatment of each such set of remains and funerary objects.

B. Final Disposition of Human Remains

The FRA and Authority will ensure that every effort is taken to avoid disturbing known human burial sites. Where avoidance is not possible, and in consultation with appropriate tribal representatives and if applicable, Federal land management agencies with jurisdiction, burials will be removed prior to construction and treated in accordance with applicable federal and state laws and as outlined in the treatment plan developed for each undertaking.

XIV. CURATION

A. Collections from Federal Lands

Federal agencies party to this Agreement will be responsible for curation of all records and other archeological items resulting from identification and data recovery efforts on Federal lands is completed in accordance with 36 CFR Part 79, and if the archaeological materials are determined to be of Native American origin, the agencies will follow NAGPRA regulations and procedures set forth in 43 CFR Part 10. The Authority shall ensure that documentation of the curation of these materials is prepared and provided to the affected parties to this Agreement within 10 days of receiving the archaeological materials.

B. Collections from Private Lands

Private landowners will be encouraged to curate archeological materials recovered from their lands in accordance with 36 CFR Part 79 and the provisions of 43 CFR Part 10. Materials from private lands to be returned to the private landowners after completion of the undertaking shall be maintained in accordance with 36 CFR Part 79, and 43 CFR Part 10 if the archaeological materials are determined to be of Native American origin, until all necessary analysis has been completed. The Authority shall document the return of materials to private landowners or alternate curation facilities and submit copies of this documentation to the affected parties to this Agreement. Landowners will be encouraged to rebury items close to their original location.

C. State Lands

The Authority will ensure that all cultural materials discovered on state lands will be curated in accordance with 36 CFR Part 79, the provisions of 43 CFR 10 if the archaeological materials are determined to be of Native American origin, and California Guidelines for the Curation of Archeological Collections (May 7, 1993). The Authority will encourage state land agencies to consult with Native American tribes and groups, affiliated with the cultural materials, on repatriation. Appropriate treatment and disposition may occur through onsite reburial of the cultural materials recovered from state lands. In the event that the state agencies and consulting tribes cannot agree, the FRA will ensure that all cultural materials discovered on state lands will be curated in accordance with the project MOA and Treatment Plan.

XV. DOCUMENTATION STANDARDS

A. All documentation that supports the findings and determinations made under this Agreement shall be consistent with 36 CFR 800.11 and shall be in accordance with the Authority's requirements and its subsequent revisions or editions and with attachments to this Agreement. Documentation shall be submitted to the Authority and prepared by QIs who, at a minimum, meet the Secretary of the Interior's Professional Qualifications Standards (48 FR 44738-44739) (Appendix A to 36 CFR Part 61). The Authority shall review the documentation for adequacy, and transmit all documentation cited herein as stipulated by this Agreement.

B. All documentation prepared under this Agreement shall be kept on file at the Authority and the FRA and made available to the public without the inclusion of culturally sensitive information that may jeopardize confidentiality as stipulated by this Agreement, consistent with applicable confidentiality requirements and Federal records management requirements.

XVI. AUTHORITIES

Compliance with the provisions of this Agreement does not relieve the FRA or other federal agencies of their responsibilities to comply with other legal requirements, including those imposed by the NAGPRA (25 U.S.C. Section 3001 and 43 CFR 10), the ARPA (16 U.S.C. Section 470 aa-47011), and the NEPA (42 U.S.C. Section 4321-4347), and applicable Executive Orders.

XVII. ADMINISTRATIVE STIPULATIONS

A. Dispute Resolution

1. Should any signatory to this Agreement object within 30 days to any action proposed or any document provided for review pursuant to this Agreement, the FRA shall consult with the objecting signatory to resolve the objection. If the FRA determines that the objection cannot be resolved within 15 days, the FRA shall forward all documentation relevant to the dispute, including the FRA's proposed resolution, to the Council. The FRA will also provide a copy to all signatories and consulting parties for the undertaking. The Council shall provide the FRA with its advice on the resolution of the objection within 30 days of receiving adequate documentation. Prior to reaching a final decision on the dispute, the FRA shall prepare a written response that takes into account any timely advice or comments regarding the dispute from the signatories and consulting parties, including Native American tribes, and provide them with a copy of this written response. The FRA will then proceed according to its final decision.

   If the Council does not provide its advice regarding the dispute within 30 days, the FRA may make a final decision on the dispute and proceed accordingly. Prior to reaching such a final decision, the FRA shall prepare a written response that takes into account any timely comments regarding the dispute from the signatories and consulting parties for the undertaking, and provide them and the Council with a copy of such written response.

2. Should a consulting party or member of the public disagree with findings, made pursuant to this Agreement, the Authority shall immediately inform the signatories in writing and take the objection into account. The Authority shall consult with the objecting party and, if the objecting party so requests, with any or all of the other signatories for no more than 30 days. Within 14 days following closure of the consulting period, the FRA shall render a decision regarding the objection and notify all parties of this decision in writing. In reaching the decision, the FRA shall take comments from all parties into account. The FRA's decision regarding resolution of the objection will be final.

3. The FRA's and the Authority's responsibility to carry out all other actions under this Agreement that are not subject to dispute will remain unchanged.

B. Amendment

1. The signatories to this Agreement may request that it be amended, whereupon the signatories will consult to consider such amendment. This agreement may be amended only upon written concurrence of all signatory parties.

2. To address minor changes in the undertaking or the treatment of historic properties affected by the undertaking, the Authority may propose revisions to the treatment plans rather than to this Agreement. Upon the written concurrence of the signatories, the FRA may revise the treatment plans to incorporate the agreed upon changes without executing a formal amendment to this agreement.

3. Revisions to an attachment to this Agreement would be implemented through consultation and include any necessary revisions to the Agreement itself that may result from modification of an attachment.

C. Review and Reporting

1. The signatories and consulting parties, including Native American tribes, may review activities carried out by the Authority pursuant to this Agreement. The Authority shall facilitate this review by compiling specific categories of information to document the effectiveness of this Agreement and by making this information available in the form of a written annual Programmatic Agreement report. Categories of information shall include, but are not limited to, a summary of actions taken under this Agreement, including all findings and determinations, public objections, and inadvertent effects or foreclosures. The range and type of information included by the Authority in the written report and the manner in which this information is organized and presented must be such that it facilitates the ability of the reviewing parties to assess accurately the degree to which the Agreement and its manner of implementation constitute an efficient and effective program under 36 CFR Part 800.

2. The Authority shall prepare the written report of these findings annually following execution of this Agreement. The Authority shall submit the annual reports to the FRA, the SHPO, and the Council no later than three (3) months following the end of the State fiscal year until all treatment is completed. There will be a 30-day period to review and comment on the report. The Annual Programmatic Agreement Report will be finalized within 30 days of receipt of comments.

3. The Authority shall provide that the report herein prescribed is available for public inspection. The report will be sent to signatories and consulting parties, including Native American tribes, of this Agreement and any subsequent MOAs, and a copy available to members of the public for comment, upon request.

4. In conjunction with the review of the reports prepared by the Authority, the signatory parties shall consult in an annual teleconference to review the overall effectiveness and benefits of this Agreement, determine if its requirements are being met, decide if amendments to the Agreement are warranted, review the reporting format and categories for adequacy, and identify any other actions that may be needed in order to take into account the effects of the undertakings on historic properties in California.

D. Termination

The FRA, the Council, the SHPO, or the Authority may terminate this Agreement by providing 30 days written notice to the other signatories; the signatories shall consult during the 30-day period prior to

termination to seek agreement on amendments or other actions that would avoid termination. Should such consultation result in an agreement on an alternative to termination, the signatory parties shall proceed in accordance with that agreement. Should a signatory party propose termination of this Agreement, they will notify the other parties in writing. If any of the signatories individually terminates their participation in the Agreement, then the Agreement is terminated in its entirety. In the event of termination, then the FRA shall either consult in accordance with 36 CFR 800.14(b) to develop a new Agreement or request the comments of the Council pursuant to 36 CFR 800. Beginning with the date of termination, the FRA shall ensure that until and unless a new Agreement is executed for the actions covered by this Agreement, such undertakings shall be reviewed individually in accordance with 36 CFR 800.4-800.6.

E. Duration of this Agreement

In the event that the terms of this Agreement are not carried out within 10 years, this Agreement shall be assessed by the signatories to determine if it is working well, or whether it should be terminated. If the Agreement is effective and its duration needs to be extended, the signatories can decide to extend the duration of the Agreement. If the signatories determine that the Agreement is effective, but needs revisions appropriate revisions based on evaluation of patterns in the implementation of the Agreement over the first 10 years will be made. In the event the signatories determine that the Agreement is not effective and cannot be amended to address concerns, the Agreement shall be considered null and void, memorialized in a letter to the signatories from the FRA. If the FRA or another Federal agency party to this agreement chooses to continue with the undertaking, it shall re-initiate review of the undertaking in accordance with 36 CFR Part 800. Otherwise, the FRA and all other appropriate signatories shall comply with 36 CFR 800 Subpart B with regard to individual actions covered by this Agreement.

F. Execution and Implementation of the Agreement

This Agreement and its attachments shall take effect following execution by the Council. Additional attachments or amendments to this Agreement shall take effect on the dates they are fully executed by the FRA, the SHPO, the Council, and the Authority.

Execution of this Agreement by the FRA, the Authority, SHPO, and the Council and implementation of its terms evidence that the FRA has taken into account the effects of this undertaking on historic properties and afforded the Council an opportunity to comment.

ATTACHMENT B

AREA OF POTENTIAL EFFECTS DELINEATION

In accordance with Stipulation VI.A. of this Agreement, The Authority shall establish the Area of Potential Effects (APE) for undertakings covered by this Agreement. The Authority using Qualified Investigators (QIs) would be responsible for describing and establishing the APE and will sign any maps or plans that define or redefine an APE.

As defined in 36 CFR 800.16(d), an APE is "the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist. The area of potential effects is influenced by the scale and nature of an undertaking and may be different for different kinds of effects caused by the undertaking."

Different APEs may be established for archeological properties and historic architectural properties:

Archaeological Properties

For archeological properties, an APE is typically established based on an undertaking's potential for direct effects from ground-disturbing activities. On occasion, archeological sites may also have qualities that could be affected indirectly.

The APE for archaeological properties is the area of ground proposed to be disturbed during construction of the undertaking, including grading, cut-and-fill, easements, staging areas, utility relocation, borrow pits, and biological mitigation areas, if any.

Traditional cultural properties and cultural landscapes are more likely to be subject to indirect, as well as direct, effects, thus the APE for such properties is usually broader than the archeological APE in order to include the potential for such effects. For instance, the first row of potential properties beyond the right-of-way may be subject to such effects and thus included in an indirect APE when warranted.

Historic Architectural Properties

The APE for historic architectural properties includes all properties that contain buildings, structures or objects more than 50 years of age at the time the intensive survey is completed by the QIs, as follows:

1. Properties within the proposed right-of-way;
2. Properties where historic materials or associated landscape features would be demolished, moved, or altered by construction;
3. Properties near the undertaking where railroad materials, features, and activities *HAVE NOT* been part of their historic setting and where the introduction of visual or audible elements may affect the use or characteristics of those properties that would be the basis for their eligibility for listing in the National Register; and
4. Properties near the undertaking that were either used by a railroad, served by a railroad, or where railroad materials, features, and activities *HAVE* long been part of their historic setting, but only in such cases where the undertaking would result in a substantial change from the historic use, access, or noise and vibration levels that were present 50 years ago, or during the period of significance of a property, if different.

For the California High-Speed Train Project, a key phrase in the APE definition in the Section 106 regulations contained within 36 CFR 800.16(d) is "may...cause alterations in the character or use of historic properties" because many of the undertakings involve the construction of high speed rail alongside existing railroads. In such cases, potential historic properties near the proposed undertaking

historically had railroad features, materials, and activities within their setting that contributed to their character, or may even have been used by or served by the railroad. For example:

- the character and use of a historic railroad passenger or freight depot or railroad bridge *would not change* unless it would be put out of service, destroyed, altered, or moved for the undertaking;
- the character and use of an industrial building next to existing railroad tracks *would not change*, unless freight railroad service was an important association and the spur lines or loading areas would be removed by the undertaking;
- The character and use of buildings *would not change* if they would be separated from the undertaking by an existing railroad; however,
- the character of a non-railroad or non-industrial building *would likely change* if the building is visually sensitive and the proposed undertaking introduces an elevated grade separation or other large building or structure;
- the use of a non-railroad or non-industrial building *would likely change* if the building is sensitive to noise, like a school, museum or library, and the frequency of noise or vibration events from passing trains is increased over historic-era railroad events.

However, some sections of an undertaking may be introducing rail service where none existed during the historic era, for example along a highway or through agricultural fields. For such sections, the undertaking is more likely to change the character or use of a historic property, and the APE would take into account changes to its setting and the introduction of visible or audible elements that are out of character with the property. Other effects to be considered when delineating the APE may include, but are not limited to, physical damage or destruction of all or part of a property; physical alterations; moving or realigning a historic property; isolating a property from its setting; visual, audible, or atmospheric intrusions; shadow effects; damage from vibrations; and change in access or use.

When delineating the APE, the QIs shall follow the identification methodology in Stipulation VI.B., which are different for archaeological properties and historic architectural properties. The QIs shall take into account the nature of the proposed undertaking and whether or not it has the potential to affect the characteristics that might qualify the property for eligibility to the NRHP. Whenever an undertaking is revised (e.g., design changes, utility relocation, or additional off-site mitigation areas), the QIs will determine if changes require modifying the APE. If an APE proves to be inadequate, the Authority is responsible for informing consulting parties in a timely manner of needed changes. The APE should be revised commensurate with the nature and scope of the changed potential effects.

ATTACHMENT C

HST PROGRAM DOCUMENTATION AND FORMAT GUIDELINES

PURPOSE

The purpose of the HST program method for evaluation of cultural resources is to describe, in greater detail, how the FRA and the Authority will implement the Section 106 process for each HST section and ensure that the identification and evaluation of cultural resources is conducted in accordance with the *Secretary of Interior's Standards and Guidelines for Archeology and Historic Preservation (Standards and Guidelines) (48 CFR 44716-44742) and* 36 CFR 800.4.

The historic properties that should be identified include any prehistoric or historic district, site, building, structure, or object included in or eligible for inclusion in the National Register of Historic Places (NRHP) maintained by the Secretary of Interior. This includes artifacts, records, and remains which are related to such district, site, building, structure, or object (16 U.S.C. Section 470(w)(5)). The term includes properties of traditional religious and cultural importance to an Indian Tribe or organization that meet the National Register criteria. Properties eligible for inclusion in the National Register can be properties that are formally determined as such in accordance with regulations of the Secretary of Interior and all other properties that meet the National Register criteria. The level of identification needed varies depending on the nature of the property or property type, the nature of the agency's authority, and the nature of the proposed undertaking's possible effects on the property. Properties that the QIs may find exempt from evaluation are described in Stipulation VI.B.3 and Attachment D.

METHODOLOGY FOR IDENTIFICATION OF HISTORIC PROPERTIES

The Area of Potential Effects (APE) would be delineated as described in Stipulation VI.A and Attachment B, using the best professional judgment of the QIs and taking into account historic property sensitivity and the effects that would occur from construction and operation of the undertaking. An APE Map showing the most current engineering available for the undertaking and the boundary delineated by QIs would be submitted to SHPO with the Historic Property Survey Report (HPSR) or separately if SHPO concurrence with adequacy of the APE is desired prior to the HPSR. The APE maps would be on an aerial base at a scale of 1″=250′ in urban areas and 1″=400′ in rural areas and indicate whether the project is at-grade, elevated, or in tunnel configuration.

In consultation with the SHPO and other parties to the Section 106 process, including Native American tribes, FRA and the Authority will identify resources, determine eligibility, and treat any adverse effects, as outlined in 36 CFR Part 800 following guidance developed by the National Park Service and in conformance with the Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation 1983 (48 FR 44716, as amended) as enumerated below:

- To identify known locations of historic properties within the APE, review the records for previously recorded archaeological properties and historic architectural properties at the local Information Center (IC) of the California Historical Resources Information System (CHRIS). While at the IC, collect information on recorded sites within the APE, for the range of alternative HST project alignments. Review previous survey technical reports conducted within the APE for historic contexts, bibliography, and determination of significance of sites. Review historic USGS maps. Review properties listed in the National Register of Historic Places and the California Register of Historical Resources, the California Historical Landmarks and Points of Historical Interest lists, Land Grant maps, Online Archive of California, Government Land Office Plat Maps, and Sanborn Fire Insurance Maps for urban areas as appropriate.

- Review survey findings conducted by local governments, historical societies, or historic preservation organizations, local historic landmark or monument designations, and any other inventories that may help identify or establish the significance of historic properties.
- Review subdivision maps, assessor maps, county/city directories, utility records, building permits, photographs, newspapers, diaries/journals, architectural drawings, Agency Records, Residential- and Commercial-Building Records, oral histories, thesis/dissertations, and preferred local and credible history studies. Research should be conducted with the appropriate agencies, knowledgeable individuals, local and regional historical societies, archives, and libraries.
- Develop relevant historic themes and contexts for the identification and evaluation efforts of historic properties within the APE. Use National Register Bulletin No. 15 for guidance.
- Employ standard archaeological inventory methods. Conduct presence/absence testing, if necessary, in areas where subsurface remains may be present. For resources that cannot be avoided conduct test excavations to determine resource significance in accordance with the research design.
- Consult with interested Native American Tribe(s) and other cultural groups to identify and evaluate any potential TCPs and cultural landscapes that could be affected by the project following the methods outlined in the National Register Bulletin 38 and the Secretary of the Interior's Standards for the Treatment of Historic Properties, respectively.
- Perform an intensive survey to identify, record, and evaluate architectural properties adjacent to the proposed alignment, stations and support facilities built within the time period identified in the plan to document and inventory all historic buildings, structures, objects, districts, and cultural landscapes in sufficient detail to permit evaluation for the NRHP (per Section 106 of the NHPA) and the California Register of Historic Resources (CRHR) (per California Public Resources Code Section 5024.1 and 21084.1). Use field maps at 1" = 250' scale that have delineated parcel boundaries, APE boundaries, Assessor Parcel Numbers (APNs), street names, prominent natural and man-made features, and previously recorded sites. Based on the number of historic properties within the APE, a field database may be required. Documentation and evaluation efforts will follow the guidelines of National Register Bulletin No. 15 and the California Office of Historic Preservation (OHP) Instructions for Recording Historic Properties (DPR 523 series forms). Private spaces (i.e., building interiors), suburban backyards, and restricted areas will not be surveyed. Surveys will occur from public vantage points, and if access is infeasible, then the property will be evaluated solely on available information or right-of-entry will be coordinated by the Authority.

TECHNICAL REPORTS

- After completion of the archaeological and historic architectural research, inventories and evaluations, and tribal consultations prepare reports to document the findings and identification effort, and if any historic properties are identified for an undertaking, prepare a report to analyze the effects of the undertaking. Technical reports will be submitted to SHPO in both hard copy and electronic format, and the evaluations made on DPR 523 forms will also be submitted in a data format that is compatible for uploading to SHPO's historical resource inventory database. At a minimum, the technical reports shall follow the following format and content requirements.

A. Historic Property Survey Report (HPSR)

The HPSR would include documentation of all properties in the APE that are:

1. listed in the NRHP,
2. previously determined eligible for the NRHP,
3. found eligible for the NRHP by QIs,
4. presumed eligible for the NRHP by QIs, or
5. that are ineligible for the NRHP and meet one of the following conditions:
    a. The property was identified as significant in a state, regional, or local survey of historic properties.
    b. The property was designated under a state, regional, or local ordinance with criteria for evaluating properties with historic or architectural significance.
    c. The property was identified by the SHPO, THPO, or any party identified as a result of Stipulations IV and V.
    d. The property is not exempt from evaluation as identified in Attachment D and would be acquired, destroyed, demolished, or substantially altered as a result of the undertaking.

The HPSR would *NOT* include documentation of:

1. Properties that are exempt from evaluation as identified in Attachment D.
2. Non-exempt and non-NRHP eligible properties with the exception of Section A.5, above. Such properties would be documented in the Archaeological Survey Report (ASR) or Historic Architectural Survey Report (HASR).

The HPSR format and content is as follows:

1. Description of the Undertaking

    This section shall summarize the description of the undertaking, its location, and any alternatives being considered. If alternatives have been developed to avoid or minimize effects on historic properties, those alternatives may be described here or in the Findings of Effect report.

2. Summary of Findings

    This section should include findings for historic properties identified in the APE, and for any non-eligible properties for which SHPO concurrence on ineligibility is needed early in the environmental process.

3. Consulting Parties, Public Participation

    This section shall summarize the coordination efforts and public comments received to date from federal, state, and local government agencies, Native American groups, historical societies, or other interest groups. The summary should include outreach done specifically for Section 106 as well as for NEPA.

4. Summary of Identification Effort

   Include inventories, facilities, groups, and persons consulted to identify previously determined and potential historic properties.

5. Historic Context

   Include those historic contexts developed to evaluate the historic properties identified. Other historic contexts that were developed may be listed in the HPSR, and reported in the ASR or HASR.

6. Historic Properties Identified

   Provide a list of historic properties identified within the APE, and a brief description of their significance, including the applicable NRHP criterion or criteria, and level, period, and area of significance. Include, as appropriate:

   a. Historic properties listed in the NRHP.
   b. Historic properties previously determined eligible for the NRHP.
   c. Historic properties determined eligible for the NRHP for which SHPO concurrence is requested.
   d. Archaeological properties that are currently being evaluated and are presumed eligible for the NRHP
   e. Properties evaluated as not eligible for the National Register, for which SHPO concurrence is needed early in the NEPA process.

7. Findings

   Summarize the findings for historic properties identified within the APE for which SHPO concurrence is sought.

8. References

   Include bibliographic references used for the historic contexts and any literature, inventories or surveys used to identify or evaluate historic properties.

9. Preparer qualifications

   List the QIs and their qualifications who prepared the HPSR and evaluated the historic properties.

Attachments to the HPSR:

1. Project location and vicinity maps

2. Area of Potential Effects Map

3. Letters from historical societies, Native American groups, local governments, other special interest groups, etc.

4. DPR 523 forms supporting the findings for historic properties in the HPSR. The DPR 523 forms shall be prepared in accordance with the California Office of Historic Preservation's *Instructions for Recording Historical Resources* (March 1995) for intensive survey level of effort.

B. Archaeological Survey Report (ASR)

The ASR includes all documentation for the identification and evaluation of archaeological resources not submitted to SHPO in the HPSR. This includes those resources that are not eligible for the NRHP and are non-exempt according to Attachment D. The ASR may be submitted as an attachment to the HPSR or as a subsequent document in support of the overall Section 106 findings. The ASR format and content is as follows:

1. Introduction

    a. This section should include a discussion about the PA and how it was followed in this document.

2. Summary of Findings

    a. This section should include The Authority's findings for any archaeological properties evaluated and determined not eligible for the NRHP for which SHPO concurrence is being requested within 30 days of receipt of the ASR.

    b. For reference, this section should include a summary of those archaeological properties reported to SHPO in the HPSR.

3. Description of the Undertaking

    a. This section shall summarize the description of the undertaking, its location, and any alternatives being considered.

4. Description of the APE

    a. This section should include a description of the APE, the application of the PA guidance and how the boundary was determined.

5. Summary of Identification Effort

    a. Include inventory and field methodologies (including a description of any sub-surface investigation, if appropriate), results of archival research including Sanborn mapping as appropriate, and involvement of the public including Native American groups, and individuals.

6. Historic and Geomorphic Context

    a. Include those historic contexts developed to evaluate the archaeological resources to determine if they are historic properties eligible for the National Register of Historic Places. The report should also describe the geomorphology of the project area and assess the potential for previously unrecorded buried archaeological resources.

7. Findings

    a. Summarize the findings for properties determined eligible for the NRHP, that were identified within the APE and for which SHPO concurrence is sought. Provide a

description of properties found not eligible for the NRHP within the APE, and a description of the property, its location, and why it lacked significance.

8. References

    a. Include bibliographic references used for the historic contexts and any literature, inventories or surveys used to help evaluate the properties according to NRHP criteria.

9. Preparer qualifications.

    a. List the QIs and their qualifications, that prepared the ASR and evaluated the properties ineligible for the NRHP.

Attachments to the ASR:

1. Project location and vicinity maps
2. Area of Potential Effects Map
3. Letters from Native American groups, local governments, historical societies, other special interest groups, etc.
4 DPR 523 forms supporting the findings for properties ineligible for the NRHP in the ASR. The DPR 523 forms shall be prepared in accordance with the California Office of Historic Preservation's *Instructions for Recording Historical Resources* (March 1995) for intensive survey level of effort.

C. Historic Architectural Survey Report (HASR)

The HASR includes the documentation for evaluating historic architectural properties that are not eligible for the NRHP, are non-exempt according to Attachment D, and were not reported in the HPSR. The HASR may be submitted as an attachment to the HPSR or as a subsequent document. The HASR format and content is as follows:

1. Introduction

    a. A discussion about the PA and how it was followed in this document.

2. Summary of Findings

    a. This section should include The Authority's findings for any non-eligible properties for which SHPO concurrence is requested within 30 days of receipt of the HASR, but which were not submitted in the HPSR.

    For reference, this section should include a summary of those historic architectural properties reported to SHPO in the HPSR.

3. Description of the Undertaking

    a. This section shall summarize the description of the undertaking, its location, and any alternatives being considered.

4. Description of the APE

a. Description of the APE, the application of the PA guidance and how the boundary was determined.

5. Summary of Identification Effort

    a. Include inventories, facilities, groups, and persons consulted to identify previously determined and potential historic properties not reported in the HPSR.

6. Historic Context

    a. Include those historic contexts developed to evaluate the properties evaluated in the HASR that are not eligible for the NRHP.

7. Properties Identified as Not Eligible for the NRHP,

    a. Provide a list of properties found not eligible for the NRHP within the APE, and a brief description of that describes the property, its location, and why it lacked significance. This may be done in a simple table format.

8. Findings

    a. Summarize the findings for properties not eligible for the NRHP that were identified within the APE and for which SHPO concurrence is sought.

9. References

    a. Include bibliographic references used for the historic contexts and any literature, inventories or surveys used to help evaluate the properties according to NRHP criteria.

10. Preparer qualifications

    a. Identify and list the qualifications of the QIs who prepared the HASR and evaluated the properties ineligible for the NRHP.

Attachments to the HASR:

1. Project location and vicinity maps

2. Area of Potential Effects Map

3. Letters from historical societies, Native American groups, local governments, other special interest groups, etc.

4. DPR 523 forms supporting the findings for properties ineligible for the NRHP in the HASR. The DPR 523 forms shall be prepared in accordance with the California Office of Historic Preservation's *Instructions for Recording Historical Resources* (March 1995) for intensive survey level of effort.

5. Streamlined documentation format for *substantially altered* properties constructed more than 50 years ago will be provided as follows:

    a. Address

b. Year constructed

c. List of substantial alterations and/or lost aspects of integrity

d. Photograph (may be less than 3"x5", but legible)

e. Date surveyed

f. Optional information. The following documentation may be provided, but is optional at the discretion of the QI:

i. Construction or historical information to understand the historic context (*e.g.,* original use, original owner, architect, engineer, builder, and/or historic resident/tenant/user.)

ii. Historic contexts considered, if any, or state "no important historic context"

6. Streamlined documentation format for tract homes and pre-fabricated homes more than 50 years old that are *NOT* eligible for the National Register but are *NOT substantially altered.*

a. Tract homes within the APE that are part of the same tract may be treated as a group with a common construction history and evaluated on a Primary Record (DPR 523A), District Record (DPR 523 D), and Continuation sheets (DPR 523L) that have photographs of representative house models.

b. Pre-fabricated homes that are not associated with permanent buildings or a historic district of pre-fabricated homes will be provided:

i. Address

ii. Photograph (may be less than 3"x5", but legible)

iii. Date surveyed

iv. Optional information. The following documentation may be provided, but is optional at the discretion of the QI:

a) Approximate year fabricated

b) Name of fabricator or model

D. Findings of Effect (FOE)

The Findings of Effect (FOE) report documents the application of the Section 106 criteria for adverse effect (36 CFR 800.5) for each historic property identified within the APE, including all properties reported in the HPSR. The FOE also includes any avoidance alternatives, mitigation measures, or treatment plan as needed for each historic property or property type being adversely affected. Such mitigation and treatment would form the basis for the stipulations in the subsequent MOAs. The FOE should be organized to report on the following findings for an undertaking:

- No effect on historic properties.
- No adverse effect on historic properties (with no mitigation or after standard mitigation).
- Adverse effect on historic properties.

The FOE format and content is as follows:

1. Summary of Findings of Effect

This section should include a summary of findings for any historic properties identified, and whether the effect on them would be negative, not adverse, or adverse, and how the effect is taken into account.

2. Description of the Undertaking

   This section shall summarize the description of the undertaking, its location, and any alternatives being considered.

3. Public Participation

   Discuss consultation about effects and mitigation with federal, state, and local government agencies, Native Americans, historical societies, or other interest groups. The summary should include outreach done specifically for Section 106 as well as for NEPA. Identify any parties who would be consulting parties in the subsequent MOA.

4. Description of Historic Properties

   Using information developed in the HPSR, summarize the historic properties identified in the APE, and describe the essential physical features that comprise the characteristics that qualify each property for the NRHP.

5. Application of the Criteria of Adverse Effect

   Discuss the application of the Criteria of Adverse Effect for each historic property. State the most relevant of the criteria and describe in detail the nature of the effect on its essential physical features and how it is adverse or not adverse.

6. Conditions Proposed

   Discuss in detail any conditions proposed to avoid adverse effect to each historic property. Present separate sub-sections for any alternatives proposed, or design changes that would be a condition to mitigate the adverse effect, including design considerations to ensure meeting the Secretary of the Interior's Standards for the Treatment of Historic Properties (36 CFR part 68). With SHPO concurrence on the FOE, such mitigation would form the basis for stipulations in a subsequent MOA for the undertaking.

E. Treatment Plans

All Treatment Plans for the independent undertakings of the HST Project will include, but not be limited to:

1. Specification of all historic properties to be affected by the project, including a description of the nature of the effects.

2. A detailed description of the treatments proposed for historic properties or portions of historic properties eligible for the NRHP under 36 CFR Part 60.4 criteria (a), (b), (c) or (d), with an explanation or rationale provided for the choice of the proposed treatments. These treatments will take into account the setting, including but not limited to, visual and atmospheric elements, and vibration, as appropriate, and be responsive to the qualities that contribute to the significance of the affected properties.

3. Provisions for the creation of a popular account for disseminating the results of the Treatment Plans to the general public, consistent with the Archaeological Resources Protection Act (ARPA), Executive Order on Sacred Sites, the Freedom of Information Act and Section 304 of the NHPA (16 U.S.C. 4702-3).

4. The archaeological Treatment Plan will, at a minimum, include:

   A. The Authority's intent to recover a reasonable sample of the intact archaeological deposits from eligible archaeological sites that the agency determines, through the process set out in Stipulation VII of the Agreement, that may be adversely affected by the implementation of the Undertaking;

   B. Specify the research issues/questions to be addressed through the recovery of data, and provide for a process whereby the research issues/questions will be refined to reflect the information that the Authority gathers as a result of the investigation set out in Stipulation VII of the Agreement;

   C. Explain why it is in the public interest to address those research issues;

   D. Explain how data from the historic property will address those research issues/questions;

   E. Specify the methods to be used in fieldwork and analysis, and explain how these methods are relevant to the research issues/questions;

   F. Specify the methods to be used in data management and data dissemination;

   G. Indicate how recovered materials and records will be curated, taking into account the expressed wishes of the consulting Native Americans;

   H. Include a schedule for providing the consulting Native American Tribes with periodic updates on implementation of the data recovery plan;

   I. Include a curation agreement that ensures that all materials (other than Native American human remains and grave associated materials) and records are maintained in accordance with 36 CFR 79. Materials recovered from privately owned lands, other than Native American human remains and grave-associated materials that are to be returned to their owners, will be maintained in accordance with 36 CFR 79 until their analysis is completed; and

   J. Specify the manner in which human remains and grave associated artifacts recovered during data recovery will be treated according to applicable laws and regulations, and in consultation with the wishes of the consulting Native Americans.

ATTACHMENT D

PROPERTIES EXEMPT FROM EVALUATION

Section 106 regulations require a "reasonable and good faith effort" to identify historic properties (36 CFR 800.4[b][1]). The procedures in this attachment concentrate the Authority's efforts on properties that have the potential to be historic properties. A property should be evaluated only if QIs reasonably determine that the property has a demonstrable potential for historic significance. Evidence of such potential consists of associations with significant historic events or individuals (NRHP Criteria A or B); engineering, artistic, design, or aesthetic values (NRHP Criterion C); information value (NRHP Criterion D); the presence of community concerns; or inclusion as a potential contributing element within a larger property requiring evaluation, such as a historic or cultural landscape, traditional cultural property, or historic district. This attachment defines categories of properties that do not warrant evaluation unless deemed otherwise in the professional judgment of QIs. Exempted properties do not require documentation.

ARCHEOLOGICAL PROPERTIES (PREHISTORIC AND HISTORIC) EXEMPT FROM EVALUATION

The following properties are exempt from evaluation, based on the professional judgment of QIs qualified in the area of archaeology:

- Isolated prehistoric finds consisting of fewer than three items per 100 square meters
- Isolated historic finds consisting of fewer than three artifacts per 100 square meters (e.g., several fragments from a single glass bottle are one artifact)
- Refuse scatters less than 50 years old (scatters containing no material that can be dated with certainty as older than 50 years old)
- Features less than 50 years old (those known to be less than 50 years old through map research, inscribed dates, etc.)
- Isolated refuse dumps and scatters over 50 years old that lack specific associations
- Isolated mining prospect pits
- Placer mining features with no associated structural remains or archeological deposits
- Foundations and mapped locations of buildings or structures more than 50 years old with few or no associated artifacts or ecofacts, and with no potential for subsurface archeological deposits
- Building and structural ruins and foundations less than 50 years old.

QIs qualified in California archaeology shall apply professional judgment as to the level of identification effort, in consultation with consulting Native American Tribe(s) where appropriate. This exemption process does not include archeological sites, traditional cultural properties, or other cultural remains or features that may qualify as contributing elements of districts or landscapes.

HISTORIC ARCHITECTURAL PROPERTIES EXEMPT FROM EVALUATION

QIs qualified in the disciplines of history or architectural history may find the following types of historic architectural properties exempt from evaluation and documentation, or have a lesser level of documentation in the HASR:

1. Properties less than 50 years old at the time of the intensive survey unless they may have achieved exceptional significance in accordance with NRHP Bulletin 22.
2. Properties moved within the past 50 years unless they are among the exceptions noted in "Criteria Consideration B: Moved Properties" of National Register Bulletin 15.

The historical architectural property types listed below are exempt from evaluation and will not require documentation, based on the professional judgment of QIs qualified in the disciplines of history or architectural history.

Railroad Related Features:

- Railroad maintenance facilities
- Railroad communication and signaling systems
- Switching and crossing equipment
- Railroad structures such as grade separations, pedestrian overcrossings and underpasses
- Railroad culverts and drainage systems
- Railroad fencing and other right-of-way features
- Access roads for railroads
- Railroad maintenance materials (e.g., ties, track, ballast, etc.)
- Railroad grades converted to other uses, such as roads, levees, or bicycle/pedestrian paths

Water Conveyance and Control Features:

- Natural bodies or water providing a water source, conveyance, or drainage
- Modified natural waterways
- Concrete-lined canals less than 50 years old and fragments of abandoned canals
- Roadside drainage ditches and secondary agricultural ditches
- Small drainage tunnels
- Flood storage basins
- Reservoirs and artificial ponds
- Levees and weirs
- Gates, valves, pumps, and other flow control devices
- Pipelines and associated control devices
- Water supply and waste disposal systems

Recent Transportation or Pedestrian Facilities:

- Light rail systems, including shelters, benches, and platforms
- Bus shelters and benches
- Airstrips and helicopter landing pads
- Vista points and rest stops
- Toll booths
- Truck scales and inspection stations
- City streets, alleys, and park strips
- Sidewalks, curbs, berms, and gutters
- Bike paths, off-road vehicle trails, equestrian trails, and hiking trails
- Parking lot and driveways

Highway and Roadside Features:

- Isolated segments or bypassed or abandoned roads
- Retaining walls
- Curbs, gutters, and walkways
- Highway fencing, soundwalls, guard rails, and barriers
- Drains and culverts, excluding culverts assigned a Caltrans bridge number
- Cattle crossing guards
- Roadside, median, and interchange landscaping and associated irrigation systems
- Street furniture and decorations
- Signs and reflectors
- Parking meters
- Street lighting and controls
- Traffic lights and controls
- Highway operation control, maintenance, and monitoring equipment

- Telecommunications services, including towers, poles, dishes, antennas, boxes, lines, cables, transformers, and transmission facilities
- Utility services, including towers, poles, boxes, pipes, lines, cables, and transformers
- Oil and gas pipelines and associated control devices

Adjacent Features:

- Prefabicated buildings less than 50 years old not associated with permanent buildings or a historic district
- Fences, walls, gates, and gateposts
- Isolated rock walls and stone fences
- Telephone booths, call boxes, mailboxes, and newspaper receptacles
- Fire hydrants and alarms
- Markers, monuments, signs, and billboards
- Fragments of bypassed or demolished bridges
- Temporary roadside structures, such seasonal vendors' stands
- Pastures, fields, crops, and orchards
- Corrals, animal pens, and dog runs
- Open space, including parks and recreational facilities

Movable or Minor Objects:

- Movable vehicles
- Stationary vehicles less than 50 years old or moved within the last 50 years
- Agricultural, industrial, and commercial equipment and machinery
- Sculpture, statuary, and decorative elements less than 50 years old or moved within the last 50 years.

The exemption does not apply to properties 50 years old or older that could be important, nor does it apply to properties that may contribute to the significance of larger historic properties such as districts or landscapes.

Compliance with Section 106 of the National Historic Preservation Act for the California High Speed Train System

Establish Programmatic Approach

- FRA initiates Govt. to Govt. consultation and invites Federally recognized Native American Tribes to participate in the 106 process
- Authority initiates consultation with Native American groups and consulting parties and invites them to participate in the Section 106 process, notifies SHPO
- Authority initiates information gathering, for each Undertaking
- Develop Draft Programmatic Agreement
- **CONSULTATION POINT**
  Consultation with Native American Tribes or groups, and other parties
- Execute Programmatic Agreement

Approach for Each Undertaking

Initiate Section 106 Process

Identify Historic Properties

- **CONSULTATION POINT**
  Define the APE in consultation with SHPO, THPO or other official from Federally recognized Native American Tribes
- Identify potentially eligible historic properties by survey or site testing, as appropriate.
- Evaluate properties for eligibility
- **CONSULTATION POINT**
  Confirm historic properties : Provide requested List of Historic Properties

Assess Adverse Effects

- Identify historic properties that will be adversely affected by the Undertaking
- **CONSULTATION POINT**
  Provide requested Site Records for review to Native American Tribes and other applicable parties per 36 CFR Part 800 .11(c)

  Determine when and where Tribal Monitors may be needed during ground disturbing activities in previously identified sensitive areas or known sites

  Develop Avoidance, Minimization, and Treatment Measures for Adverse Effects to both archaeological and built resources

Resolve Adverse Effects

- Develop Treatment Plans for Archaeology and Built Resources
- **CONSULTATION POINT**
  Determine Native American Tribes or groups and other parties who will participate in the development of and sign as concurring parties to the Memorandum of Agreement

  Determine when and where Tribal Monitors may be needed during Treatment Plan Implementation or Construction
- Finalize Treatment Plans
- Execute Memorandum of Agreement

Implement Treatment Plans & Construction

- **CONSULTATION POINT**
  Include Native American Tribes or groups and other parties who are participating as concurring parties in implementation of treatment as defined in the Treatment Plans

  Provide for Tribal Monitors during Treatment Plan Implementation or Construction, where agreed upon

  Review and comment on Programmatic Agreement Annual Report

APPENDIX 3.18-A: RIMS II MODELING DETAILS

APPENDIX 3.18-A: RIMS II MODELING DETAILS

Summary of Findings

This appendix presents the results of the Regional Input-Output Modeling System (RIMS II) modeling analysis supporting the analysis presented in Section 3.18, Regional Growth. Overall, this study finds that development and operation of the California High-Speed Rail (HSR) System in the San Jose to Central Valley Wye Project Extent (project extent or project) would have a positive economic effect on the regional resource study area (RSA) composed of Santa Clara, San Benito, and Merced Counties. The results reported herein are those obtained at the time the analysis was completed and reflect the estimates of costs, projected construction schedule and other modeling inputs for the project available at that time, including those provided in Appendix 6-A, San Jose to Merced Project Section: PEPD Record Set Capital Cost Estimate Report, July 2019.

The estimate of total economic effect, including direct and multiplier effects from the construction phase, is approximately $7.33 billion to $10.43 billion in this region, depending on the project alternative, measured in constant 2018 dollars. Alternative 3 would yield the highest regional economic impact, roughly 42 percent greater than Alternative 4, which would have the lowest cost and employment impact. The estimate for direct spending for construction labor and materials ranges from $5.21 billion to $7.42 billion, and the remaining spending represents indirect spending on labor and materials by companies in the supply chain for construction (e.g., wholesalers of concrete or lessors of construction equipment), as well as induced spending in industries required to serve the households of construction and indirect labor workers (e.g., retail, entertainment, healthcare). During the peak year of construction (2024), direct spending is estimated to support between 5,110 and 7,990 construction-related job-years,[1] depending on the project alternative.

By 2040, the ongoing project operations would support an estimated $210 million per year in economic activity within the regional economy. Again, this economic activity would represent direct spending by the California High-Speed Rail Authority (Authority) on labor and materials for operations and maintenance, as well as indirect spending by supply-chain industries and induced spending in household-serving industries. Phase I project operations are projected to support 1,110 jobs annually in the RSA, including 600 workers directly employed by the Authority or its vendors. Spending and employment associated with operations would not vary substantially among the project alternatives because of similar guideway lengths and the same number of stations and types of maintenance facilities.

Analysis Framework and Approach

The economic impacts calculated and reported in this appendix are directly linked to spending attributable to the project and are considered using the accepted economic metrics of economic output, employment, and employee compensation. Project-related expenditures on goods and services from within the regional economy would create a multiplier effect as local and regional businesses that supply inputs to production generate successive rounds of spending. Employment supported by HSR would also generate a multiplier effect through household spending in the regional economy.

Input-Output Analysis Overview

Input-Output (I/O) analysis is based on the concept that industries in a geographic region are interdependent and thus the total contribution of any one establishment's activity is larger than its individual (direct) output or employment. Consequently, an establishment's economic activity has a multiplier effect that generates successive rounds of spending and output in other economic sectors within a particular region. For example, construction firms purchase goods from producers, who in turn purchase raw materials from suppliers. Thus, an increase or decrease in

[1] One job-year is equivalent to one job held by one person over one year's duration.

the demand for construction supplies would stimulate an increase or decrease in output and employment in interdependent secondary industries.

Regional economic impact analysis and I/O models in particular provide a means to quantify economic effects stemming from a particular industry or economic activity. I/O models produce quantitative estimates of the magnitude of regional economic activity resulting from some initial activity. I/O models rely on economic multipliers that mathematically represent the relationship between the initial change in one sector of the economy and the effect of that change on employment, income, economic output, and value added in other regional industries. These economic data provide a quantitative estimate of the magnitude of shifts in jobs and revenues within a regional economy.

The analysis begins with an estimate of the initial economic input associated with project expenditures on capital investment and operations in the regional economy. These initial inputs are referred to as the direct effect. Next the I/O model quantifies the impacts associated with the multiplier effects that result from that initial economic input. Multiplier effects include indirect or induced effects. Indirect effects represent economic impacts on suppliers while induced effects represent economic impacts on household income and spending. In this report, direct, indirect, and induced effects are defined as follows:

- **Direct effect**—The economic value of the initial input of spending into the economy made by the Authority
- **Indirect effect—**The economic value of "upstream" industry-to-industry transactions that supply inputs to the production of goods and services consumed by the Authority
- **Induced effect—**The economic value of labor income that recirculates in the economy as a result of the initial expenditures made by the Authority
- **Total impact**—The sum of the direct, indirect, and induced effects. The total impact measures the overall impact of project activities within the regional economy

This analysis measures economic significance using common economic metrics, including employment, employee compensation, economic output, and job-year as defined below:

- **Employment**—Equivalent to jobs, a headcount that includes part-time and full-time workers.
- **Employee compensation**—Payments to labor in the form of income (i.e., wages and salaries) and fringe benefits paid by the employer (e.g., health insurance), as well as proprietor income.
- **Economic output**—Economic activity, calculated as production value including intermediate inputs (i.e., the goods and services used in the production of final products). Output includes spending on employee compensation as well as the production value of each intermediate input, such as equipment, supplies, insurance, rents, utilities, communication services, printing, and other goods and services.
- **Job-years**—A combined measure of total jobs and the length of time of those jobs. One job-year is defined as equivalent to one job held by one person over one year's duration. As an example, one job held by one worker for three years would constitute three job-years; three jobs held by three workers for one year's duration would also constitute three job-years.

It should be noted that a portion of the impacts reported in this analysis may not be entirely net new. For example, it is plausible that the State of California would have spent a portion of its HSR budget on other projects elsewhere in the state if the HSR project did not occur.

RIMS II Multipliers

To measure the economic effects of the project in the RSA, this I/O analysis relies on RIMS II multipliers acquired from the U.S. Bureau of Economic Analysis (BEA 2013). The multipliers are the most current available at the time the analysis was conducted, that is, those based on 2007 national input-output data and 2016 regional data. The multipliers were acquired from the Bureau

on October 12, 2018, and are specific to the regional economy composed of Santa Clara, San Benito, and Merced Counties. The multipliers are produced as tables organized both by selected detailed industries, as defined under the North American Industry Classification System (NAICS), and by NAICS industry aggregations or sectors, as defined by the U.S. Bureau of Economic Analysis.

RIMS II multipliers in two industry aggregations are most directly relevant to the construction phase and the operations and maintenance phase of the project. For the construction phase, Industry Aggregation #7 Construction (NAICS Industry Sector 23) multipliers are the most generally applicable to local construction cost estimates for RSA, and are shown in Table 1.

Table 1 RIMS II Multipliers Relevant to Project Construction in the Resource Study Area

Industry	Multiplier					
	Final Demand				Direct Effect	
	Output[1] (dollars)	Earnings[2] (dollars)	Employment[3] (jobs)	Value-Added[4] (dollars)	Earnings[5] (dollars)	Employment[6] (jobs)
7. Construction	1.4061	0.3586	6.3204	0.7725	1.3591	1.5117

Source: BEA 2018

[1] Represents the total dollar change in output that occurs in all industries for each additional dollar of output delivered to final demand by the industry corresponding to the entry.

[2] Represents the total dollar change in earnings of households employed by all industries for each additional dollar of output delivered to final demand by the industry corresponding to the entry.

[3] Represents the total change in number of jobs that occurs in all industries for each additional 1 million dollars of output delivered to final demand by the industry corresponding to the entry. Because the employment multipliers are based on 2016 data, the output delivered to final demand should be in 2016 dollars.

[4] Represents the total dollar change in value added that occurs in all industries for each additional dollar of output delivered to final demand by the industry corresponding to the entry.

[5] Represents the total dollar change in earnings of households employed by all industries for each additional dollar of earnings paid directly to households employed by the industry corresponding to the entry.

[6] Represents the total change in number of jobs in all industries for each additional job in the industry corresponding to the entry.

Note: Multipliers are based on the 2007 Benchmark Input-Output Table for the Nation and 2016 regional data.

For the operations and maintenance phase, Industry Aggregation 33 Rail Transportation (NAICS Industry Sector 482) multipliers are the most generally applicable to operations and maintenance (O&M) cost estimates for the RSA. These multipliers are shown in Table 2.

Dollar inputs for analysis models using RIMS II multipliers should be indexed to the same year as the multipliers applied. Analysts used Construction Cost Index developed for the Authority's *2016 Business Plan Capital Cost Basis of Estimate Report* (Authority 2016) to adjust the capital and construction cost estimates for this analysis, which were provided in 2018 dollars (Authority 2019), to the 2016 dollars pertinent to the RIMS II multipliers.. An inflation factor of 2.25 percent per annum is assumed to pertain between Fiscal Year 2016/2017 and Fiscal Year 2024/2025 for the Construction Cost Index, and has been applied as necessary to convert 2018 dollars to 2016 dollars for analysis and to use 2018 dollars for uniform reporting.

Table 2 RIMS II Multipliers Relevant to Project Operations and Maintenance in the Resource Study Area

Industry	Multiplier					
	Final Demand				Direct Effect	
	Output[1] (dollars)	Earnings[2] (dollars)	Employment[3] (jobs)	Value-Added[4] (dollars)	Earnings[5] (dollars)	Employment[6] (jobs)
33. Rail Transportation	1.3389	0.2602	3.5442	0.7250	1.4597	1.8531

Source: BEA 2018

[1] Represents the total dollar change in output that occurs in all industries for each additional dollar of output delivered to final demand by the industry corresponding to the entry.

[2] Represents the total dollar change in earnings of households employed by all industries for each additional dollar of output delivered to final demand by the industry corresponding to the entry.

[3] Represents the total change in number of jobs that occurs in all industries for each additional 1 million dollars of output delivered to final demand by the industry corresponding to the entry. Because the employment multipliers are based on 2016 data, the output delivered to final demand should be in 2016 dollars.

[4] Represents the total dollar change in value added that occurs in all industries for each additional dollar of output delivered to final demand by the industry corresponding to the entry.

[5] Represents the total dollar change in earnings of households employed by all industries for each additional dollar of earnings paid directly to households employed by the industry corresponding to the entry.

[6] Represents the total change in number of jobs in all industries for each additional job in the industry corresponding to the entry.

Note: Multipliers are based on the 2007 Benchmark Input-Output Table for the Nation and 2016 regional data

Construction Cost Estimates

In addition to RIMS II data, this analysis relies on detailed capital cost estimates. Capital cost estimates for RIMS II modeling were assembled from data provided in the capital cost estimates for the four project alternatives. These sources itemize costs using the Authority's refinement of the Federal Railroad Administration's (FRA) standard cost categories, which establish a consistent format for the reporting, estimating, and managing capital costs.[2]

As shown in Table 3, the project alternatives are estimated to have total capital costs ranging from approximately $16.48 billion to $23.31 billion (2018$), including the costs of right-of-way and land acquisitions, but excluding the cost of HSR trains (train sets, support and maintenance vehicles, and parts), and finance charges. These exclusions are not anticipated to have a significant effect on regional job creation or system-wide costs. The development budget analyzed for the regional economic impacts reflects the total construction costs. These construction costs include "hard" development costs, but exclude the costs of right-of-way and land acquisitions and further exclude professional services as many or most of the design, administrative, consulting, monitoring, and accounting services may be conducted outside of the RSA.

The hard costs include all aspects of construction, including site work, track construction, bridge construction, maintenance facility development, and other construction requirements. These estimated total construction costs range from $12.71 billion to $18.09 billion (2018$), depending on the project alternative. The total capital cost estimates include unallocated contingency budgets that are about 3.8 percent of the sum of all other costs for Alternatives 1, 2, and 3 and about 3.7 percent of all other costs for Alternative 4. The same ratios of unallocated contingency costs, have been assumed in calculations of total construction costs and local construction costs, by project alternative.

[2] The *San Jose to Merced Project Section: PEPD Record Set Capital Cost Estimate Report* provides estimates capital costs for the project section alternatives (Appendix 6-A). These capital cost estimates are limited to SCC groups 10 to 60, and 80 to 90, which include most of the SCC cost categories directly related to the labor and materials involved in construction of the rail system and support facilities. Total construction costs for the project section correspond to cost estimates for SCC Groups 10 to 60 and a share of Group 90 Costs, and exclude 40.07-Right-of-Way Purchase and Land Costs.

Local construction costs are estimates of the development budget expenditures within the three-county RSA of Santa Clara, San Benito, and Merced Counties. For a project of the scale and specialized requirements of the HSR, a substantial amount of manufacturing and fabrication of the system's construction components would likely occur outside of the RSA. The amount of project-related manufacturing and fabrication that occurs within the RSA, and the amount of money spent within the RSA to hire construction workers, is calculated as portions of the local construction costs. For the project, the overall local percentage capture ratio has been estimated at 41 percent of total construction costs.[3] The estimated local construction costs thus range from $5.21 billion to $7.42 billion (2018$), depending on the project alternative. The great majority of those costs are for the guideway construction, with the small remainder for the construction of the station and maintenance facilities.

Construction of the project's guideway, stations, and maintenance facilities is planned for the years 2022 through 2028, with 2024 identified as the peak year of construction activity. As shown in Table 4, this construction schedule has been used to spread the estimated local construction costs for the project alternatives based on general anticipated expenditures associated with construction activities.

[3] The analysis assumed local construction expenditures in the RSA would equal about 41 percent of total construction costs, based on review of U.S. Bureau of Labor Statistics Quarterly Census of Employment and Wages (QCEW) historical data for the RSA, California and the nation and upon analysts' professional judgement. Total construction costs correspond to cost estimates for SCC Groups 10 to 60 and a share of Group 90 Costs, and exclude costs for 40.07-Right-of-Way Purchase and Land Costs.

Table 3 Project Alternatives' Costs by Standard Cost Category (2018$[4])

Standard Cost Category[1]/Alternative	Alternative 1		Alternative 2		Alternative 3		Alternative 4	
	Total Capital Costs	Total Construction Costs	Total Capital Costs	Total Construction Costs	Total Capital Costs	Total Construction Costs	Total Capital Costs	Total Construction Costs
10 track structures & track[2]	$13,271,520,000	$13,271,520,000	$9,865,455,000	$9,865,455,000	$13,473,346,000	$13,473,346,000	$8,678,042,000	$8,678,042,000
20 Stations, terminals, intermodal[3]	$830,279,000	$830,279,000	$819,713,000	$819,713,000	$873,691,000	$873,691,000	$698,399,000	$698,399,000

[1] Capital Cost estimates are exclusive of costs for Standard Cost Categories (SCC) 70-Vehicles and 100-Finance Charges. Construction Cost estimates are exclusive of costs for SCC 40.07-Right-of-Way Purchase and Land Costs.
[2] Cost estimates for SCC Categories 10, 40, 50, and 60 plus a proportional share of SCC Category 90-Unallocated Contingency is assumed to be track construction costs. Cost estimates for SCC Categories 20–30 plus a proportional share of SCC Category 90 assumed to be stations and maintenance facility construction costs.
[3] Local construction assumed equal to 41% of total construction.

Economic Impacts from Construction

This analysis assumes that approximately 41 percent of the total construction expenditures for the project would be made in the regional economy; that is, in the three-county RSA. As shown in Table 5, the direct employment for construction is projected at between 5,110 and 7,990 jobs in the peak year 2024 depending on the project alternative. Table 5 presents the estimated total one-time economic impact of construction of the project on the RSA.

Table 5 Total One-Time Economic Impact of Construction (2018$)

Alternative/Sector	Output (2018$)[1]	Employment (Job-Years)[1]	Employee Compensation (2018$)[1]
Alternative 1

Consideration of Overlapping HSR Project Section Construction Schedules and Construction Worker Commute Sheds

The project is just one of several HSR project sections expected to be constructed within a relatively short timeframe and in relative proximity. The RSA for the project includes Santa Clara County, which is also one of the counties in the RSA for the San Francisco to San Jose Project. The San Francisco to San Jose Project Section construction period (2021–2025) is anticipated to overlap the construction period anticipated for this project (2022–2028). The Central Valley Wye Project also has a construction period (2019–2023) that is anticipated to partially overlap the construction period anticipated for this project (2022–2028). Construction workers experienced on any of these adjacent project sections would provide valuable labor resources for the others, and the estimated daily commute sheds for the different project sections would also overlap. Approximately 55,300 (or 55 percent) of the 100,400 employed residents who were primarily employed as construction workers in 2017 and living within the 90-minute commute shed for the San Francisco to San Jose Project Section were also residing within the commute shed for this project. Approximately 5,630 (or about 10 percent) of the 54,900 employed residents who were primarily employed as construction workers in 2017 and living within the 90-minute commute shed for the Central Valley Wye Project were also residing within the commute shed for this project. (U.S. Census Bureau 2019a, 2019b; Attachment 1 to this appendix).

Economic Impacts from Operations

The analysis of operations is based on data obtained from the Authority, including estimated system-wide operating and maintenance costs (Authority 2017a). In addition, the analysis relied on detailed program data to allocate costs to the project.[4] Specifically, the analysis used

[4] Project route miles within Santa Clara, San Benito, and Merced Counties were estimated using the length of the midline of Alternatives 1, 2, 3 and 4 (per GIS shapefile set: JM_SingleCenterline_AllAlts_ZipFinal_20181008.zip) The length of the alternatives' midline may differ from route miles for the individual alternatives and from the project mileage estimates in the Authority's *2018 Business Plan Capital Cost Basis of Estimate Report* (Authority 2018a).

personnel estimates and route miles as the primary metric through which operations costs are allocated from HSR system-wide totals to specific HSR project sections.

In 2040, the Authority anticipates that the total operating budget for the Phase I system will be approximately $874 million (2015$ millions) (Authority 2017a). Total operating and maintenance (O&M) staffing for the entire Phase I system in 2040 is projected by the Authority at 3,540 jobs (Authority 2017c). The number of staff associated with each project section will ultimately depend on final decisions regarding the locations of the maintenance facilities, the operation and control center, and the California High-Speed Rail Headquarters. Interim estimates of the San Jose to Central Valley Wye project O&M staffing in 2040 used in this analysis is 600 jobs or about 17 percent of the Phase I estimate for total jobs systemwide, based on a pro-rata allocation of the systemwide O&M jobs by ratio of the project's centerline route miles to total route miles systemwide (Authority 2018).

The same ratio of the project's centerline route miles to total route miles systemwide is applied to allocate Phase 1 O&M cost estimates to the individual Phase 1 project sections.[5] About $147 million (2015$), or about 17 percent of the projected operating budget, is estimated for the San Jose to Central Valley Wye project. The operations expenses include regional spending on employee compensation and goods and services. The operations and maintenance employment would include train operations, dispatching, maintenance of equipment, track, and systems, station and train cleaning, and general and administrative positions associated with the tracks, stations in San Jose and Gilroy and rail yards and maintenance facilities. Other operating budget costs would involve commercial activities, insurance, and contingency funds. No heavy maintenance facilities are proposed for the project.

Analysts used the Construction Cost Index developed for the Authority's 2016 Business Plan Capital Cost Basis of Estimate Report (Authority 2016) to adjust operations and maintenance expense estimates made in 2015 dollars to the 2016 dollars pertinent to the RIMS II multipliers described previously. An inflation factor of 2.00 percent per annum is assumed to pertain between Fiscal Year 2015/2016 to Fiscal Year 2016/2017 in the Construction Cost Index, and has been applied as necessary to convert 2015 dollars to 2016 dollars for analysis.

Approximately 600 O&M jobs are estimated as direct impacts of the project as part of Phase 1 operations, which is forecast to create approximately 3,540 permanent O&M jobs system-wide by 2040 (Authority 2017a). The direct O&M jobs would include train operations and dispatching, infrastructure and equipment maintenance, station and train cleaning, ticketing and other commercial activities, and administration. Approximately 510 additional permanent jobs are estimated for the RSA, as indirect and induced impacts of the direct O&M employment and expenditures. The indirect and induced jobs would include additional employment supporting, servicing, or supplying train operation, administration and dispatching, infrastructure and equipment maintenance, station and train cleaning, ticketing and other commercial activities, and other occupations, such as security, operations of concessions, provision of goods and services to riders entering and leaving the HSR system.

The total direct, indirect and induced annual employment impact of operations and maintenance would be 1,110 jobs. Table 6 shows the estimated total recurring economic impact of project operations. Most of the anticipated occupations for these project O&M jobs would be in service sectors of the economy. The California Employment Development Department (CEDD) estimated 515,600 service jobs in the RSA in 2015; California Department of Transportation (Caltrans) projects 717,280 service jobs in the RSA by 2040 (Caltrans 2015). The addition of 1,110 O&M-related service jobs would represent increments of only about 0.22 percent and 0.15 percent of the existing (2015) and future (2040) estimates of the No Project Alternative service-sector

[5] Analysts used O&M Phase I 2040 Medium Cost Scenario estimates (Authority 2017a) in conjunction with estimates of route miles by project section (Authority 2018a). The Construction Cost Index developed for the Authority's 2016 Business Plan Capital Cost Basis of Estimate Report (Authority 2016) to adjust the operating cost estimates for this analysis, which were provided in 2015 dollars (Authority 2017a), to the 2016 dollars pertinent to the RIMS II multipliers and for RIMS II calculations.

employment in the RSA. The California Employment Development Department and Caltrans projections of total employment for the RSA are 1,125,900 jobs (2015) and 1,387,360 jobs (2040), respectively. The addition of 1,110 O& M-related jobs would represent increments of about 0.10 percent and 0.08 percent of the existing (2015) and future (2040) estimates of No Project Alternative total employment in the RSA.

Table 6 Total Recurring Economic Impact of Stabilized Project Operations (2018$)

Sector	Output (2018$) [1]	Employment (Job-Years) [2]	Employee Compensation (2018$)
Direct impact	$157,212,900	600	$42,599,400
Indirect/induced impact	$53,279,500	510	$19,582,900
Total impact	$210,492,400	1,110	$62,182,300

Sources: Authority 2017a; BEA 2018
[1] Direct output is based on the project's estimated $147 million (2015$) share, based on proportional route miles, of the estimated annual systemwide operations and maintenance costs under the O&M Phase I 2040 Medium Cost Scenario. The project's Phase 1 direct operations and maintenance jobs are estimated at about 600 of approximately 3,540 total jobs systemwide in 2040.
[2]. Calculated by application of RIMS II Direct Effect Employment Multipliers for Industry Aggregation 33 Rail Transportation

In aggregate, as shown in Table 7, direct, indirect and induced employment gains associated with operations and maintenance of the HSR system would represent a very small addition to the expected growth in the entire RSA—less than 0.1 percent more total employment by 2040 than projected under the No Project Alternative.

Table 7 Operations-Related Employment Growth

Region	Year 2015 Existing	No Project Alternative 2015–2040 Growth	No Project Alternative 2040 Baseline Forecast	Project Phase I O&M Direct, Indirect & Induced Growth	Project Total O&M Growth Inducement
RSA	1,125,900	261,500	1,387,400	1,110	0.08%

Sources: CEDD 2016; CDOF 2016; Authority 2017a, 2017c.
CEDD = California Employment Development Department
CDOF = California Department of Finance
O&M = operations and maintenance
HSR = High-Speed Rail
RSA = resource study area
[1] Regional O&M direct employment is projected at about 1,110 by 2040, based on the project extent's approximate share of systemwide route miles and Authority 2017a.

APPENDIX 3.19-A: CUMULATIVE NONTRANSPORTATION PLANS AND PROJECTS LISTS

Since publication of the Draft Environmental Impact Report/Environmental Impact Statement, the following substantive changes have been made to this appendix:

- The status of cumulative nontransportation plans and projects, including the Downtown West Mixed-Use Plan, B.F. Sisk Dam Safety of Dams Modification Project, and B.F. Sisk Dam Raise and Reservoir Expansion Project, was updated in Tables 1 through 6.

Table 1 Santa Clara County Nontransportation Plans and Projects List

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
1	Santa Clara County General Plan[1]	Plan to promote managed, balanced growth; livable communities; responsible resource conservation; and social and economic well-being.	Land use plan	Adopted 12/20/1994; Housing Element adopted June 10, 2014; Health Element adopted August 25, 2015; Land Use Map updated 2013	None	Unincorporated areas and 15 cities of Santa Clara County
2	Santa Clara Valley Habitat Plan[2]	Plan to protect, enhance, and restore natural resources in specific areas of Santa Clara County, while improving and streamlining the environmental permitting process for impacts on threatened and endangered species	Habitat conservation plan	Adopted August 2012	None	"specific areas of Santa Clara County, plus City of San Jose, City of Morgan Hill, City of Santa Clara"
3	Pacheco Pass Landfill Composting Facility Expansion[3]	Increase the total SWFP permitted boundary from 18.3 acres to 46 acres. The permitted boundary will be expanded to include existing ancillary facilities such as the scale house, retention ponds, and pipelines that serve South Valley Organics compost operations. Composting activities remain restricted to the existing western compost pad and eastern expansion area. Increase permitted traffic volume from 260 vehicles per day to 341 vehicles per day.	Landfill expansion project	Permit issued July 31, 2015	None	3675 Pacheco Pass Road, in the southern portion of unincorporated Santa Clara County
4	Sargent Quarry[4]	Proposed sand and gravel mining operation construction and operation of aggregate processing facilities, on 320 acres of the approximately 6,400-acre Sargent Ranch property currently used for cattle grazing.	Mining operation	Draft EIR to be published fall 2020	Aesthetics; air quality; biological resources; cultural resources; energy; geology and soils; GHG; hazards; hydrology and water quality; land use; noise; public services; transportation; utilities and service systems	APNs 810-38-014, -016, and -017 approximately four miles south of the City of Gilroy, west of Highway 101 in Santa Clara County
5	Cordoba Center[5]	Proposed religious and cultural institution (Cordoba Center) would include a mosque, a community building for education, recreation and assembly, an ancillary graveyard, and youth camp. Facilities have been designed to accommodate up to 300 persons for scheduled religious services with greater anticipated capacity for occasional special events.	Religious and cultural center	Approved by Planning Commission in spring 2020	Aesthetics; cultural resources; hydrology and water quality; noise; transportation and circulation; utilities and energy	15.8-acre site fronting on Monterey Road just north of California Avenue, San Martin (14065 Monterey Road, APN: 779-06-002)

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
6	Plan Bay Area 2040[6]	Plan is a limited and focused strategic update of the region's previous integrated regional transportation and land use plan, Plan Bay Area, adopted in 2013. Plan Bay Area 2040 guides the nine-county region in meeting the requirements of California's landmark 2008 Senate Bill 375, which calls on each of the state's 18 metropolitan planning organizations to develop a Sustainable Communities Strategy (SCS) as part of their long-range Regional Transportation Plan (RTP). The joint RTP/SCS must accommodate future population growth while reducing per-capita carbon dioxide emissions from cars and light trucks – performance targets achieved by Plan Bay Area 2040.	Land use plan	Adopted July 26, 2017	None	The entire Bay Area, including the nine counties and the 101 cities and towns that make up the region.
7	Anderson Dam Seismic Retrofit[7]	Project objectives include stabilizing the dam embankment for the maximum credible earthquakes, modify or replace the outlet works to protect against potential fault rupture risk from the maximum credible earthquake on the Coyote Creek-Range Front fault zone, and to incorporate other measures to address safety deficiencies, including potential spillway modifications that are determined to be necessary.	Water/ supply project	Started FY 2014; to be completed FY 2028	Geology, soils, and seismicity, hydrology and water resources	Located 18 miles southeast of San Jose, California. The dam lies 1 mile from the Calaveras Fault and on top of the Coyote Creek-Range Front Fault Zone.
8	Pacheco Conduit Inspection and Rehabilitation[8]	This project plans, designs, and constructs major repairs and improvements to the District's pipelines and tunnels to accomplish the following objectives: perform internal inspections, maintenance, and repair activities as required, replace old valves, flow meters, pipeline appurtenance assemblies, and piping as appropriate, upgrade pipeline air valve venting in accordance with CA Department of Public Health (CDPH) guidelines, and modify failure prone pipeline appurtenance connections.	Water supply project	Complete	Hydrology and water resources	Pipeline located in Santa Clara County, from San Luis Reservoir southwest to San Benito County, then running northwest parallel with US 101.
9	Pacheco Reservoir Expansion Project[9]	The Santa Clara Valley Water District, Pacheco Pass Water District and the San Benito County Water District are working to secure funding for a $1 billion project that will increase Pacheco Reservoir's storage capacity and deliver water supply, water quality and ecosystems benefits to the region and the Sacramento-San Joaquin Delta. On the north folk of Pacheco Creek, the expanded reservoir project includes the construction of an earthen dam made of rock and other soil materials located within the footprint of the existing reservoir. The project will increase the reservoir's capacity from 5,500 to 140,000-acre feet, enough water to supply 1.4 million residents for a year	Water supply project	Construction to begin in 2027; construction anticipated to be complete in 2029; operation anticipated to begin in 2029	Hydrology and water resources, geology, soils, and seismicity	Located 60 miles southeast of San Jose and sits north of Highway 152.
10	Upper Llagas Creek Flood Protection[10]	This project continues a Clean, Safe Creeks project in partnership with the U.S. Army Corps of Engineers (USACE) and the state to plan, design, and construct improvements along 13.9 miles of channel. The federally authorized preferred project protects the urban area of Morgan Hill from a 1% (or 100-year) flood, and reduces the frequency of flooding in surrounding areas. Construction includes channel modifications and replacement of road crossings. The District continues to work with Congress to aggressively pursue federal funds to bring this project to full fruition. In 2012, project limits were extended 2,700 feet upstream to Llagas Road to address public concerns.	Flood risk management project	Construction of Phase 1 began in summer 2020; construction anticipated to be complete in 2024	Hydrology and water resources, land use, biological resources, noise, parks, recreation, and open spaces, agricultural and forest resources, socioeconomics, public utilities and energy	13.9 miles of Llagas Creek from Buena Vista Avenue to Wright Avenue, including West Little Llagas Creek in downtown Morgan Hill.

Table 2 City of San Jose Nontransportation Plans and Projects Project List

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
1	Envision 2040[11]	General plan for the City of San Jose	Land use plan	Adopted 11-1-11; revised 3-16-2020	None	City of San Jose
2	Communications Hill Specific Plan[12]	Mixed use development for up to 2,200 residential units (single-family and multi-family), up to 67,500 square feet of commercial/retail uses, 55 acres of industrial park uses, public parks, open space, trails, streets, stormwater facilities, and associated infrastructure on approximately 332 acres within the Communications Hill Specific Plan Area.	Land use plan	Adopted 4-7-92; amended through 2014	Aesthetics, air quality, transportation	332 acres bounded by Curtner Avenue to the north, Monterey Road to the east, Capitol Expressway, Snell Avenue, and Hillside Avenue to the south, and SR 87 to the west
3	Diridon Station Area Plan[13]	Land use plan for a 250-acre area including Diridon Station and the surrounding area in response to the planned extension of BART and HSR service to San Jose	Land use plan	Adopted June 17, 2014	Transportation	250 acres bounded by Lenzen Avenue and the UPRR tracks to the north, Interstate 280 to the south, the Guadalupe River and Delmas Avenue to the east, and Sunol Avenue and the Diridon Station commuter rail tracks to the west
4	San Jose Downtown Strategy 2000[14]	Long-range conceptual program for revitalizing the Downtown by allowing high density infill development and replacement of underutilized uses, and expanding the Greater Downtown Core Area and land use intensities to the west and north into areas that are presently undeveloped and underutilized	Land use plan	Adopted June 2005; amended October 2014 and July 2016	Air quality, cultural resources, transportation	Area generally bounded by Coleman Avenue and the extension of Washington Street on the north, 4th Street through 7th Street to the east, Interstate 280 on the south, and White street and Stockton Avenue on the west
5	San Jose Downtown Strategy 2040 (final)[15]	Update of *Downtown Strategy 2000*, including an update of residential capacity and revised development phasing to extend the horizon (buildout) year to 2040. The proposed Downtown Strategy 2040 will maintain the office, retail, and hotel room capacities of the Downtown Strategy 2000 (11.2 million sq. ft. office, 1.4 million sq. ft. retail, and 3,600 hotel rooms), but would increase the residential capacity the downtown area by up to 4,000 additional units (from 10,360 in the Envision San Jose 2040 General Plan up to 14,360 units). This update would also explore other changes to the Downtown Strategy, including an increase in the area covered by the Strategy to include two blocks on the east side of N. 4th Street between Julian Street and St. John Street and the identification of Jobs Priority Areas to prioritize the development of commercial and office uses near the proposed Downtown BART station.	Land use plan	Final EIR published December 2018	Land use, transportation, noise and vibration, air quality, biological resources, public utilities and energy, aesthetics and visual resources, socioeconomics	Area generally bounded by Coleman Avenue and the extension of Washington Street on the north, 4th Street through 7th Street to the east, Interstate 280 on the south, and White street and Stockton Avenue on the west
6	Market/Almaden Neighborhood Improvement Plan[16]	Through a series of meetings, Market-Almaden residents identified a list of specific strategies (actions) that would most contribute toward positive change in the neighborhood. The goals presented form the foundation of a plan that includes 29 specific actions to improve the neighborhood.	Land use plan	Approved March, 2003	N/A	Five block area bounded on the north by The San Jose McEnery Convention Center, on the west by Almaden Boulevard, on the south by I-280, and on the east by San Jose's South First Area

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
7	Samaritan Medical Center Master Plan[17][18]	Two distinct but related medical office development proposals, including demolition of all existing medical office buildings and improvements on the 13-acre project site, and redevelopment of the site with five new buildings containing 475,250 sf of medical offices and related uses. Three 6-story, 120,000 sf medical office buildings are proposed on the 9-acre Samaritan Drive Project Area. Two three-story medical office buildings proposed for the 4-acre Samaritan Court Project Area would be approximately 69,250 and 46,000 sf, respectively. Overall, the proposed project would result in a net increase of 364,726 sf of space on the site.	Medical office development project	Draft EIR issued May, 2016, amended October, 2016	Greenhouse gases, noise, transportation	Samaritan Drive and Samaritan Court, east of Bascom Avenue-Los Gatos Boulevard
8	237 @ First Homewood Suites Hotel[19]	Construction of a 4-story hotel with 145 rooms and 150 parking spaces on a 3.5-acre site	Hotel development project	Complete	Air quality, biological resources, transportation	Northwest corner of SR 237 and North First Street
9	The 237 Industrial Center Project[20]	Two development options for a 66.5-acre site: approximately 1,197,700 square feet of light industrial development or an approximately 2.35 million square foot data center up to four stories tall. The project would require rezoning from A(PD) – Agricultural Planned Development to LI Light Industrial.	Light industrial development project	Amended Draft EIR published September 2017; Final EIR in preparation	Land use, transportation, noise and vibration, air quality, public utilities and energy, aesthetics and visual resources, socioeconomics	North of Highway 237 between Zanker Road and Coyote Creek
10	St. James Park Capital Vision and Levitt Pavilion Project[21]	Physical and programmatic changes to St. James Park, a seven-acre urban park in downtown San Jose, including development of an outdoor performing arts pavilion (Levitt Pavilion) with an amplified sound and lighting system to be used for about 50 family-friendly music concerts per year	Park/performing arts facility project	Draft EIR published July 2020; Final EIR in preparation	N/A	St. James Park, bordered by East St. James Street to the north, East St. John Street to the south, North 1st Street to the west, and North 3rd Street to the east
11	Edenvale Area Development Policy[22]	Guidance for the buildout of the Edenvale Redevelopment Project Area with approximately 7.88 million sf of additional industrial uses and associated infrastructure	Development project	Adopted 1976, updated through 2014 most recently as part of the Great Oaks Mixed Use Project	Air quality, biological resources, cultural resources, noise, land use, transportation	Old Edenvale: east of Cottle Road, north of Santa Teresa Boulevard, northwest of Bernal Road, and southwest of Monterey Road New Edenvale: generally bounded by US 101 and Coyote Creek to the west, Hellyer Avenue and the east foothills to the northeast, and Silicon Valley Boulevard to the south
12	Equinix Data Centers – Great Oaks Mixed Use Site[23]	Development of an 11.15-acre site on the eastern portion of the 76-acre Great Oaks Mixed Use property, previously approved for 260,000 square feet of office uses, with two, 193,000 square foot data center buildings	Mixed use development project	Complete	Aesthetics, air quality, transportation	11.15-acre project site (APN 706-09-117 and part of 706-09-118) within the 76-acre Great Oaks property adjacent to and just north of SR 85, and south of Monterey Highway

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
13	Gateway Tower Mixed Use Development[24]	Removal of the existing commercial building and parking lot at 493 South First Street and construction of a 25-story building, with 308 residential apartment units, 8,000 square feet of ground floor commercial space, and a parking garage with approximately 285 vehicular parking spaces and 75 motorcycle spaces. Retention and incorporation of the commercial building facades for 455 South First Street/460 South Market Street and 465-467 South First Street/470-480 South Market Street into the proposed building with the remainder of the existing buildings removed as part of the proposed redevelopment of the 0.5-acre site.	Mixed use development project	Amended Draft EIR published October 2019; Final EIR in preparation	Aesthetics, cultural resources	455 to 493 South First Street
14	Cannery Park/Hanover[25]	Proposed PD rezoning to allow development of up to 403 apartments, approximately 5,000 square feet of commercial retail space, surface parking, some residential amenities, and common areas on an 11.4-acre site. The revised PD zoning would maintain the existing historic 60,000 square foot Continental Can Company warehouse building and the Gordon Biersch Brewery building, but would change the allowed land uses in both buildings to include all uses allowed in the CIC Combined Industrial/Commercial zone district plus ministorage facilities in the Continental Can Company building with the approval of a Planned Development Permit. In addition, the project proposes to dedicate 0.74 acres of the site to the City as public parkland. The proposed mixed use building would be approximately four stories and would not exceed 65 feet in height.	Mixed use development project	Complete	None	Northwest corner of North 10th Street and East Taylor Street, at 357 – 395 East Taylor Street and 401 – 775 North 10th Street (APNs 249-07-006 and 249-09-001)
15	Flea Market General Plan Amendment and Rezoning Project[26]	General Plan amendment and rezoning of a 120-acre site to allow development up to 215,622 square feet of commercial and/or industrial buildings north of Berryessa, up to 150,000 square feet of commercial space south of Berryessa, and a combined total of 2,818 dwelling units north and south of Berryessa. A maximum of 1,000 dwelling units could be constructed north of Berryessa and a maximum of 2,300 dwelling units could be constructed south of Berryessa, but in no circumstances would the total exceed 2,818 dwelling units.	Mixed use development project	Draft EIR December 2006; Addendum 2012	Air quality, cultural resources, hazardous materials, transportation	1590 Berryessa Road
16	Garden City Rezoning Project[27]	Rezoning from the CG Commercial General and CN Commercial Neighborhood zoning districts to the CG(PD) Planned Development Zoning District to allow up to 400,000 sf of office space, up to 871 residential units, approximately 15,500 sf of retail/commercial space, and a 1.5-acre public park on a 16.7-acre site	Office, commercial, residential development project	Draft EIR published July 2019; Final EIR in preparation	Parks and Recreation, air quality and greenhouse gases, transportation and traffic, aesthetics and visual resources, public utilities and energy, noise and vibration	Southeast corner of Saratoga Avenue and Stevens Creek Boulevard. The site is bounded by the Saratoga Avenue to the west, Stevens Creek Boulevard to the north, Northlake Drive to the east, and Kiely Boulevard to the south (APNs 303-25-012, 303-25-013, 303-25-016, 303-25-022, 303-25-023, 303-25-044, and 303-25-052).
17	Baseball Stadium in the Diridon/Arena Area[28]	Proposed professional baseball stadium with a maximum seating capacity of 36,000, and a maximum height of 155 feet above finished grade on an approximately 23.1-acre site, and three off-site parking structure options. The project includes realignment of South Autumn Street and South Montgomery Street near their intersection with Park Avenue.	Stadium development project	Final EIR 2010; resolution adopted June 2014	Climate change, noise, traffic	area generally bounded by Autumn Street, Bird Avenue and Los Gatos Creek to the east and south, railroad tracks to the west, and Julian Street to the north

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
18	Midpoint at 237 Office and Industrial Project[29]	Development of two 2-story office buildings approximately 83,000 sf each, two 3-story office buildings approximately 124,500 sf each, and three one-story industrial buildings approximately 233,520 sf, 167,700 sf, and 162,540 sf, respectively, and surrounding surface parking on a 57-acre site	Office and industrial development project	Complete	Air quality, biological resources, traffic	APNs 015-44-011, -014, -016, -017, east of North First Street and north of Nortech Parkway
19	North San Pedro Tower 3 Residential Project[30]	Development of an 18-story tower with 313 residential units, approximately 2,000 sf of commercial space and three levels of above-grade parking on an approximately 1.52-acre site.	Residential development project	Under construction; anticipated completion fall 2020	None	APNs 259-24-008, -020, and -039 located at the northwest corner of Old West Julian Street and Terraine Street, bounded by Bassett Street to the north and SR 87 to the west
20	Orchard Parkway Properties[31]	Development of up to 4,151,350 sf of industrial uses, including office, research and development, manufacturing, and other related and supporting uses on an approximately 86.35-acre site	Industrial office/R&D and commercial development project	Complete	Air quality, biological resources, traffic	APNs. 101-02-011, 101-03-004, 101-03-007, 101-03-008, 101-02-016, and 101-02-017 on both sides of Orchard Parkway, west of North First Street and east of the Guadalupe River, along Atmel Way
21	363 Delmas Residential Project[32]	Demolition of three single-family residences and accessory buildings, removal of five ordinance sized trees, and construction of a 5-story multi-family residential building with up to 120 units, an alternating use parking arrangement, and Transportation Demand Management (TDM) measures to reduce parking; and, a Vesting Tentative map to consolidate four lots into one lot, and allow up to 120 residential condominiums on an approximately 0.8 gross acre site located within the Downtown and Diridon Urban Village Plan growth areas	Residential development project	Approved June, 2016; Construction pending	Air quality, cultural resources, noise, population and housing, traffic	341, 363, 365 Delmas Avenue, on the westerly side of Delmas Avenue, approximately 290 feet northerly of Auzerais Avenue (APN 264-26-006, 007, 008, 009)
22	Westfield Valley Fair Shopping Center Expansion[33]	Demolition of two stores and internal mall space to accommodate construction of approximately 685,000 sf of new retail space, including a 10-theater cinema, underground parking, and a new 6-story parking structure within the existing shopping center's 70-acre site. The project site is located in both San Jose (52 acres) and Santa Clara (18 acres).	Commercial development project	Complete	Air quality, population and housing, traffic, utilities	On Stevens Creek Boulevard, bounded by Monroe Street and U.S. Interstate 880 to the east, Forest Avenue and single-family housing to the north, and North Winchester Boulevard and commercial development to the west
23	740/750 West San Carlos Street Mixed Use Project[34]	Replacement of the current uses on the 1.06-acre 740 West San Carlos site with 95 multi-family residential units and 2,885 sf of ground floor retail space	Mixed use development project	Approved January, 2016	Air quality, greenhouse gases, noise, population and housing, traffic	740 and 750 West San Carlos Street
24	777/815 West San Carlos Street Mixed Use Project[35]	Rezone to allow a 7-story mixed use development with up to 110 multi-family residential units and approximately 3,000 sf of commercial space on the 1.3-acre site at 777 and 815 West San Carlos Street	Mixed use development project	Approved January, 2016	Air quality, greenhouse gases, noise, population and housing, traffic	777 and 815 West San Carlos Street
25	Bay 101 Casino and Mixed Use Project[36]	A mixed-use redevelopment proposal for relocation of an existing cardroom and associated uses, two new hotels with up to 470 total rooms, and a 1,644-space parking structure and off-street parking facility on approximately 19.8 acres.	Mixed use development project	Complete	Air quality, biological resources, hydrology and water quality, hazards and hazardous materials	southeast corner of North First Street and Highway 101, APNs 235-01-019 & -020

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
26	641 North Capitol Avenue Mixed Use Project[37]	A Signature Project for a Mixed Use development project that would allow two development scenarios: (1) up to 188 residential units, a minimum of 108,000 square feet of commercial space, and an approximately 43,583 square feet publicly accessible park or (2) should the planned amount of jobs be reduced in the Urban Village for which the site is located then allow up to 493 residential units, a minimum of 38,360 square feet of commercial space, and an approximately 43,583 square feet publicly accessible park, on a 10.6 gross acre site.	Mixed use development project	Under construction	None	641 North Capitol Avenue
27	Newby Island Sanitary Landfill and Recyclery[38]	The subject Planned Development Permit would effectuate the Planned Development Zoning (File No. PDC07-071, approved in 2012) and allow a vertical expansion to the existing landfill to increase the maximum height from 150 feet to 245 feet and an increase of the landfill capacity by 15.12 million cubic yards.	Landfill expansion project	Approved 2015	None	1601 Dixon Landing Road
28	Tamien Station Transit Oriented Development[39]	Construction of up to 569 residential units and up to 3,000 square feet of commercial space	Residential development project	Construction anticipated 2022 through 2024	None	Adjacent to Caltrain Tamien Station
29	Downtown West Mixed-Use Plan (Google Project)[40]	General Plan Amendment, Planned Development Rezoning, and Planned Development Permit for the development on an 81-acre site of up to 5,900 residential units; up to 7,300,000 gross sf of office space; up to 500,000 gross sf of active uses such as retail, cultural, arts; up to 300 hotel rooms; up to 800 rooms of limited-term corporate accommodations; up to two event and conference centers totaling up to 100,000 gross sf; logistics/warehouse(s) totaling approximately 100,000 gross sf; and approximately 15 acres of open space. The project also includes infrastructure, transportation, and public realm improvements.	Mixed-use development plan	Approved May 2021; construction anticipated for 2022 through 2028	Air quality, cultural resources, land use, noise, population, and housing	Mostly within Diridon Station Area Plan area (including APNs 259-28-031, 259-28-041, 259-28-044, a portion of 259-28-043, 261-34-002 through -006, 261-34-011, 261-34-023, 261-35-002, and 261-35-030)

sf = square foot
EIR = environmental impact report
NOP = Notice of Preparation

Table 3 City of Morgan Hill Nontransportation Plans and Projects List

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
1	Morgan Hill 2035 General Plan[41]	Plan update concerning land use, neighborhood form, housing, economic development, healthy communities, transportation, natural resources, and safety and security. An added emphasis on policies and actions that will help meet City climate change goals and regional growth management goals.	Land use plan	Adopted July 27, 2016	Agriculture; air quality; noise; transportation and traffic	City of Morgan Hill
2	Morgan Hill Downtown Specific Plan[42]	Plan outlines increased residential density, development standards for new commercial spaces, coordination of a parking strategy with realistic growth projects, examination of circulation patterns, and creating a plan for public investment.	Land use plan	Adopted November 4, 2009	Land use	Approximately 110 acres in downtown Morgan Hill, centered on Monterey Road and bounded by Main Avenue, Butterfield Boulevard, Dunne Avenue, and Del Monte Avenue

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
3	Belle Noci[43]	Proposed 8-unit, 3-story affordable housing complex with a parking garage on the first level	Residential development project	Complete	None	Southwest corner of Monterey Road and Ciolino Avenue
4	Butterfield – Keenan[44]	Development of up to 409 residential units on a 19-acre site	Residential development project	Final EIR published November 2014	Transportation	Three parcels (APNs 726-25-061, -078, and -079) on approximately 19.5 acres generally located southwest of the intersection of Butterfield Boulevard and Jarvis Drive
5	Cochrane – Borello[45]	Development of a gated residential community consisting of 244 single-family homes, up to 180 secondary units, a private recreation center, private streets, approximately 23 acres of private open space, private sparks, and surrounding landscaping. The project includes the realignment of the Peet Road intersection with Half Road which will include portions of 4 parcels on the south side of Peet Road.	Residential development project	Complete	Noise	East of Peet Road, north of Half Road, east of Cochrane Road, adjacent to the south side of the Santa Clara Valley Water District pump facility
6	Cochrane – Standard Pacific[46]	Development of a 135-unit single-family residential subdivision on a 40-acre site, with a 2.8-acre common open space area that includes a biotreatment and infiltration area and a hydromodification basin, and six smaller (0.06 to 1.2 acres) common open space areas	Residential development project	Complete	None	1365 Cochrane Road and 1465 Cochrane Road, on the west side of Cochrane Road adjacent to the Cochrane Road and Mission View Drive intersection
7	Condit – Evergreen[47]	Development of up to 381 residential units on an 18-acre site	Residential development project	Under construction	Transportation	Southwest of the Condit Road and San Pedro Avenue intersection (APNs 817-12-006 and 817-12-009)
8	Dunne – EAH (Belle Allori)[48]	Demolition of existing structures and construction of a three-story, 14-unit, multi-family, affordable apartment complex with a private community space and approximately 1,200 sf of commercial space on a 0.584-acre site	Mixed-use development project	Approved Improvement Agreement November, 2016	None	40 East Dunne Avenue
9	Diamond Creek Villas[49]	Demolition of existing structures and creation of two commercial parcels (0.9 and 1.3 acres) to accommodate commercial buildings of about 16,000 and 11,000 square feet, up to 101 condominium units, six townhome buildings with a total of 29 units, a daycare facility, and private streets, parking, landscaping, and private recreational use. Residential development would occupy about 6.5 acres and the streets would occupy slightly more than one acre on a 9.75-acre site.	Residential development project	Complete	None	Southwestern side of Monterey Road about 800 feet northwest of Watsonville Road
10	Belle Salici[50]	Development of 19 affordable, below market rate, multi-family apartments, as well as a 2,100-square-foot (sf) private community space, and an approximately 1,000-sf office / commercial space	Residential development project	Complete	None	16170 and 16180 Monterey Road
11	Main – Glenrock[51]	Subdivision and development of 12 lots and improvements to an existing open space area on an approximately 3.64-acre site	Residential development project	Approved Improvement Agreement December, 2015	None	APN 726-20-053, bordered by single-family residences to the north and south, East Main Avenue to the east and Calle Siena to the west

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
5	Glen Loma Ranch Specific Plan[61]	Specific plan for an approximately 359-acre site with up to 1,643 residential units, 145 acres of parks and open space, and a trail system	Land use plan	Approved 2005	Aesthetic/Visual, Agricultural Land, Air Quality, Archaeologic-Historic, Land use, Noise, Public Services, Recreation/Parks, Traffic/Circulation, Vegetation, Wetland/Riparian, Wildlife	The site is within the city of Gilroy, bounded by Uvas Creek to the north, Santa Teresa Boulevard to the west and south, and existing development to the east
6	Downtown Gilroy Specific Plan[62]	Specific plan for approximately 160 acres in central Gilroy, including up to 1,576 multi-family dwelling units and approximately 994,495 square feet of nonresidential structures potentially including retail, restaurants, entertainment, lodging, offices, commercial, research and development, and civic uses.	Land use plan	Approved November 21, 2005	Air quality; cultural resources; hazards; noise; traffic	The site extends from the Leavesley Road/Welburn Avenue intersection in the north to Luchessa Avenue in the south. The eastern boundary is generally the alley on the east side of Railroad Street, and the western boundary is the alley between Eigleberry and Church streets, with a portion extending westward to Dowdy Street between Sixth Street and Seventh Street.
7	Kroeger Subdivision[63]	Proposed subdivision on 2.67 acres for the creation and development of six single-family residential lots that vary in size from 7,900 to 11,050 square feet, related utilities infrastructure, and private streets connecting to existing Eagle Ridge Court. The proposed project also includes the creation of three open space parcels; a 0.97-acre parcel that maintains an existing 100-foot scenic easement, within which a new detention basin is proposed, a 0.02-acre parcel adjacent to the new street access, and a 0.12-acre parcel for a second detention basin	Residential development project	Approved August 2016	Aesthetics; biological resources; cultural resources; geology and soils	South of Santa Teresa Boulevard within the Eagle Ridge Planned Unit Development, approximately 200 feet south of the intersection of Ballybunion Drive and Santa Teresa Boulevard.
8	Wren Avenue Gilroy Unified School District Residential Project[64]	Subdivision of a 10.12-acre parcel into 70 single-family residential lots, 1.2 acres of private open space, and 2.71 acres of private streets and drives, with landscape walking paths and open spaces for residents	Residential development project	Approved March 21, 2016	Air quality; cultural resources; noise; transportation and traffic	8450 Wren Avenue, Gilroy
9	Santa Teresa Boulevard Townhouse Project[65]	Proposed 205 dwelling unit multi-family residential development with 472 onsite parking spaces and approximately 3 acres of open space	Residential development project	Under construction	Air quality; biological resources; hazards; hydrology and water quality; noise; transportation/traffic	Three parcels totaling 10.83 acres on the southeast corner of the Santa Teresa Boulevard and First Street (Hecker Pass Highway) intersection, Gilroy
10	Downtown Gilroy Station Area Plan[66]	Update to the existing 2005 Downtown Specific Plan and a continuation of the Gilroy High Speed Train visioning process, the plan will guide private development and public improvements in Downtown over the next 25 years with a focus on the area near the future HST station and railroad tracks.	Land Use Plan	Draft Alternatives Analysis Report June, 2016	N/A	Includes area covered in 2005 Downtown Specific Plan plus adjacent areas including the industrial areas located south of Old Gilroy Street and east of the rail line; and west of Swanston Lane and south of Leavesley Road, adjacent to South Valley Middle School.

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
11	Monterey Gateway Senior Apartments[67]	Construction of a four-story apartment complex with 75 affordable senior units on a 1.86-acre site in the downtown district, including 60 one-bedroom units and 15 two-bedroom units, with 89 percent of the units low income and eleven percent very low income	Residential development project	Approved November, 2015	N/A	East side of Monterey Road across from Ervin Court
12	North Gilroy Neighborhood Districts Urban Service Area Amendment[68]	Amendment to the City's USA boundary to include an approximately 721-acre project site, plus a conceptual development plan with a maximum of about 4,000 residential units, about 40 acres of commercial land, two school sites, and community and neighborhood parks. No development proposed as part of the amendment.	Planning area amendment, residential and commercial development	Approved 2015; status affected by LAFCO action and voter approval of Measure H	Agricultural resources; noise; transportation and traffic	The project site is bounded (generally) by Monterey Road on the east, the existing city limits on the south, Santa Teresa Boulevard on the west, and Fitzgerald Avenue on the north. Several areas within these general boundaries are excluded from the project site.
13	South County Regional Wastewater Authority Maintenance Building[69]	Construction of a new maintenance building, loading dock and vehicle wash station at the wastewater treatment plant.	Public facility development	Initial Study/Proposed Negative Declaration July 2016	Agricultural land	Unincorporated Santa Clara County, east of U.S. Highway 101 and south of State Route 152/Pacheco Pass Highway, at 1500 Southside Drive, Gilroy
14	Hampton Inn and Suites[70]	Development of a 4-story, 65,120 sf 100-room hotel with an outdoor pool and an adjacent property (5955 Travel Park Circle) which contains a vacant restaurant. Parking for the new hotel will be shared between the two properties and will contain 128 spaces.	Hotel development	Complete	Biological resources; cultural resources; geology and soils; noise; transportation/traffic	East of U.S. Highway 101 and southeast of the Monterey Road and Travel Park Circle Intersection in south Gilroy

CUP = conditional use permit
EIR = environmental impact report
USA = urban service area

Table 5 San Benito County Nontransportation Plans and Projects List

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
1	San Benito County 2035 General Plan[71]	Plan update that started in 2009. Plan elements, in order of community importance: land use, housing, agriculture, economic growth, transportation and infrastructure, natural resource protection, health and sustainability, and regional coordination.	Land Use Plan	Adopted July 21, 2015	Aesthetics; agricultural lands; air quality; biological resources; climate change; hydrology; noise; transportation	San Benito County
2	Comprehensive Land Use Plan, Frazier Lake Airpark[72]	This Comprehensive Land Use Plan seeks to protect the public from the adverse effects of aircraft noise, to ensure that people and facilities are not concentrated in areas susceptible to aircraft accidents, and to ensure that no structures or activities adversely affect navigable airspace. The aviation activity forecasts for the Airport were updated to reflect the existing (1998) aviation activity and provide at least a 20-year forecast of activity. The updated aviation activity forecasts formed the basis for preparation of 2020 aircraft noise contours. The Airport Layout Plan and updated aviation activity forecasts and 2020 aircraft noise contours formed the basis for preparation of this CLUP.	Land Use Plan	Adopted November 15, 2001	Noise and vibration	San Benito County

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
3	Hollister Municipal Airport Land Use Compatibility Plan[73]	Plan is to promote compatibility between Hollister Municipal Airport and the land uses surrounding it to the extent that these areas have not already been devoted to incompatible uses. The plan accomplishes this function through establishment of a set of compatibility criteria applicable to new development around the airport.	Land Use Plan	Adopted June 21, 2012	N/A	San Benito County
4	Panoche Valley Solar Farm Project[74]	Proposed 247-Megawatt (MW) solar energy generation facility on 2,506 acres. The proposed project would deliver electricity to the regional transmission system by interconnecting to the PG&E Moss-Panoche/Coburn-Panoche 230 kilovolt (kV) transmission line on site.	Solar Project	Complete	Aesthetics; noise	2 miles north of the intersection of Panoche Road and Little Panoche Road, and approximately 15 miles west of Interstate 5 in southeastern San Benito County
5	San Benito River Parkway and Regional Park Master Plan[75]	Master Plan for a 20-mile River Parkway along the San Benito River and Tres Pinos Creek, a focused plan for Parkway Reach Three along the San Benito River, and a park master plan for a new regional park adjacent to San Benito High School in the city of Hollister	Master Plan and park project	Draft Master Plan 2013	N/A	20-mile corridor along the northern San Benito River and a segment of Tres Pinos Creek in San Benito County
6	Del Webb at San Juan Oaks Specific Plan[76]	Proposed age-restricted retirement development including 1,084 homes, up to 65,000 sf of neighborhood commercial, a 200-room resort hotel, a 4-acre assisted living/skilled nursing/memory care facility with up to 100 beds, 6.6 acres of neighborhood parks, 16.8-acre community park, 114 acres of open space, 41 acres of agricultural preserve and a 1,243-acre permanent wildlife habitat preserve	Land Use Plan	Project on hold after developer canceled July, 2016	Aesthetics; biological resources; greenhouse gases; noise; transportation and circulation	3825 Union Road, approximately 3 miles southwest of the city of Hollister, 3.5 miles southeast of the city of San Juan Bautista and 1 mile south of SR 156 in San Benito County
7	Sunnyside Estates Project[77]	Development of an approximately 44.4-acre site with 200 single-family residential units, as well as on- and off-site improvements to serve the residential uses	Residential Development Project	Complete	Aesthetics; agricultural resources; greenhouse gases; noise; transportation and circulation	Approximately 0.5 mile south of the city of Hollister (outside the city's sphere of influence), 0.5 mile west of State Route (SR) 25, and 2.25 miles south of SR 156 in San Benito County

CUP = conditional use permit
PG&E = Pacific Gas and Electric Company

Table 6 Merced County Nontransportation Plans and Projects List

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
1	Liberty Packing Company[78]	Expansion of existing tomato processing facility including expanding several buildings, expanding cooling and settling ponds, 5 small additional buildings, extension of rail spur, expansion of outdoor product storage, and expansion of truck and trailer storage.	Agricultural Facility	Complete	Agricultural Lands, Air Quality, Water Quality, Noise and Vibration, Transportation	Merced County

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
2	Long-Term North to South Water Transfer Program[79]	Water management program for water transfers that would be purchased by CVP contractors in areas south of the Delta or in the San Francisco Bay Area and conveyed through the Delta using CVP or SWP pumps, or local facilities.	Water Management Program	NOD March, 2016	Hydrology and Water Resources	Colusa, Butte, Glenn, Merced, Placer, Sacramento, Shasta, Solano, Sutter, Tehama, Yolo, Or Yuba counties. The transfer buyers could be in Alameda, Contra Costa, Fresno, Kings, Merced, San Benito, San Joaquin, Santa Clara, or Stanislaus countries.
3	25-Year Water Transfer Program for the San Joaquin River Exchange Contractors Water Authority (2014–2038)[80]	Water Transfer Agreement with the San Luis & Delta-Mendota Water Authority makes available up to 80,000 acre feet of water conserved through tailwater recapture or other conservation measures for transfer for use by certain members of the San Luis & Delta-Mendota Water Authority for irrigation and M&I purposes. The M&I use is capped at 5,000 acre feet. Transfers are on a year by year basis available during non-critical years when the Exchange Contractors receive full Central Valley Project supplies and are subject to annual approvals. The quantity transferred for irrigation or M&I use cannot exceed full CVP contract supply to the recipient Water Authority members.	Water Management Program	NOD February 15, 2016	Hydrology and Water Resources	Merced County
4	George Reed, Inc. Merced Quarry Project and Reclamation Plan[81]	Modification of the current CUP to allow for mining below grade level, into the perched-water zone (to a depth of approximately 25 feet below grade}, to operate an asphalt batch plant and a PCC batch plant, and to change the current reclamation plan's end use from agricultural to open space with wildlife and natural-occurring vegetation. The proposed project would also amend the County General Plan land use designation of an approximately 70-acre portion of the property from Snelling RRC No. 1, Residential to Agricultural and to rezone the property from Agricultural Residential (A-R) to General Agricultural (A-1).	Mining Project	NOP December, 2009	Aesthetics, Agriculture Resources, Air Quality, Biological Resources, Hazards & Hazardous Materials, Hydrology/Water Quality, Noise, Transportation/Traffic, Greenhouse Gas Emissions	Approximately 2 miles west of Snelling and 15 miles north of Merced
5	Highway 99 Truck Stop Project at Harvey Pettit Road[82]	General Plan Amendment General Plan to establish a Highway Interchange Center (HIC) at the project site by changing the land use designation from Agricultural to Highway Interchange Center Commercial. Zone Change No. ZC11-001 would change the zoning from A-1 (General Agricultural) to H-I-C (Highway Interchange Center). Conditional Use Permit No. CUP11-011 would bring the existing uses on site into conformance with the Zoning Code, and permit the construction of a one-story tire repair shop and the re-opening of the existing restaurant. With the establishment of the HIC General Plan land use designation and acquisition of proper zoning and permits, the existing truck stop facilities would be in conformance with Merced County zoning and land use requirements. The H-I-C boundary would match the boundary of the existing truck stop and would not include any productive agricultural land.	Commercial Development Project	IS/MND December, 2012	None	Approximately four miles northwest of the City of Chowchilla and five miles southwest of the community of Le Grand

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
6	Buena Vista Subdivision[83]	Development of a 45.7-acre residential subdivision consisting of 211 single-family residential lots ranging from 5,000 to 6,000 square feet in size, a 2.21-acre park, and a 14.3-acre business park.	Residential Development Project	Approved June, 2015	Aesthetics; Agricultural Resources; Global Climate Change; Hydrology and Water Quality; Noise; Population and Housing; Public Services, Utilities, and Recreation	The proposed project is located to the east of the City of Merced in southeastern Merced County. The proposed project site is bounded by Plainsburg Road, Childs Avenue, the Burlington Northern Santa Fe (Railroad line to the north, and agricultural lands on the west.
7	Yosemite Ranch Estates[84]	Construction of approximately 287 new single-family homes in southeastern Merced County	Residential Development Project	Draft EIR July, 2008	Aesthetics, agriculture, biological resources, hydrology and water quality, land use, noise, population and housing,	Approximately 8 miles east of SR 99 and 15 miles southeast of the city of Merced, bounded by McKee Street on the west, Fresno Road on the east, existing single-family development on the north, and agricultural lands on the south
8	Merced County Airport Land Use Compatibility Plan[85]	Land use plan to promote compatibility between each airport and the land uses which surround them to the extent that these areas have not already been devoted to incompatible uses. Contains individual compatibility plans for Castle Airport, Gustine Municipal Airport, Los Banos Municipal Airport, Merced Regional Airport, and Turlock Municipal Airport.	Land Use Plan	Adopted June, 2012	N/A	Castle Airport, Gustine Municipal Airport, Los Banos Municipal Airport, Merced Regional Airport, and Turlock Municipal Airport in Merced County
9	Planada Community Plan Update[86]	Long-range land use strategy for development within the unincorporated community of Planada. The Update to the 2003 Planada Community Plan will revise several internal features of the Plan rather than change the Community growth boundaries or propose additional development.	Land Use Plan	Draft EIR December, 2016	Not applicable	Approximately 4 miles east of the City of Merced
10	Redevelopment Plan for the Castle Airport Aviation and Development Center[87]	The Redevelopment Plan satisfy local community needs by replacing previously lost jobs and revenue with new economic opportunities.	Land Use Plan	Approved November, 2011	Air quality, biological resources, hydrology and water quality, land use, noise, population and housing, transportation	Approximately 7 miles northwest of the City of Merced and approximately 66 miles northwest of the City of Fresno in the northeastern San Joaquin Valley
11	San Luis Reservoir State Recreation Area Resource Management Plan / General Plan[88]	The Resource Management Plan and General Plan (RMP/GP) addresses resource management alternatives for the Plan Area as appropriate for water quality and for natural, cultural, and recreational resource management opportunities.	Resource Management/Land Use Plan	ROD November, 2013	Water Quality, Biological Resources, Water Quality and Supply, Recreation, Cultural Resources	Includes surfaces of San Luis Reservoir, O'Neill Forebay, Los Banos Creek Reservoir, and adjacent recreation lands.
12	George Simmons Minor Subdivision and Don Chapin Company Concrete Batch Plant Project[89]	Minor subdivision (26.9 acres) to be sold for future industrial and commercial development. Construct a batch plant, bulk cement storage silos, portable cement silo, storage and fuel tanks, casting area, pump house, truck wash area, related collection facilities, and parking area	Industrial Project	Final EIS December, 2014	Aesthetics, Agricultural Land, Air Quality, Archeo-historic, Biological Resources, Drainage/Absorption, Noise, Septic System, Soil, Traffic, Vegetation, Water Quality, Water Supply, Wetland/Riparian, Land Use, Cumulative Effects	Volta Road and Ingomar Grade in Merced County

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
13	Fox Hills Community Specific Plan Update[90]	Specific Plan update for development of 3,460 residential units, including 2,098 deed-restricted units for active adult use.	Residential Project	Final EIR 2006; some infrastructure completed; project on hold	Aesthetics, agriculture, biological resources, hydrology and water quality, land use, noise, population and housing.	Interstate 5 forms most of the western boundary; a parcel of about 88 acres is located on the west side of Interstate 5. The San Luis Canal forms the eastern boundary, Pioneer Road forms the northern boundary, and a parcel line is the southern boundary.
14	Sunset Hills Development Tentative Tract Map[91]	General Plan Amendment and Zone Change to redesignate seven (7) parcels on approximately 1.2 acres from Professional Office to Medium Density Residential and to subdivide the project site into eleven (11) residential lots, ranging in size from 4,600 square feet to 5,562 square feet. The proposed lots will be subdivided and developed in accordance with Title 9, Chapter 3, Article 7, of the Los Banos Zoning Ordinance.	Residential Project	Initial Study/Mitigated Negative Declaration February 10, 2017	Aesthetics, agriculture, biological resources, hydrology and water quality, land use, noise, population and housing.	The Project site is located within the City of Los Banos, County of Merced on an approximate 1.2-acre site on the east side of Delaware Avenue between Pine Street and Madrone Street.
15	San Luis Estates[92]	Tentative Tract Map for an approximately 5.5-acre parcel into twenty-five (25) single-family residential lots, ranging from 6,000 square feet to 9,519 square feet.	Residential Project	Complete	Aesthetics, agriculture, biological resources, hydrology and water quality, land use, noise, population and housing.	The Project site is located within the City of Los Banos, County of Merced on an approximate 5.5-acre site on the south side of San Luis Street and approximately 850 feet east of Mercy Springs Road (SR 165).
16	The Villages of Laguna San Luis Community Plan[93]	6,200-acre Specific Urban Development Plan (SUDP)area including 15,895 residential units, 1.4 million square feet of commercial, 2.9 million square feet of office, three schools, fire station, and wastewater treatment plant.	Mixed-Use Plan	EIR approved	Aesthetics, agriculture, biological resources, hydrology and water quality, land use, noise, population and housing,	West of Interstate 5 (I-5) along State Route 152 (SR-152) and State Route 33 (SR-33) in western Merced County. The Villages CP is located adjacent to and south of the Santa Nella CP; adjacent and northwest of the Fox Hill CSP and approximately eight miles west of the City of Los Banos
17	San Luis Reservoir Low Point Improvement Project[94]	The objective of the SLLPIP is to optimize the water supply benefit of San Luis Reservoir while reducing additional risks to water users by: Avoiding supply interruptions when water is needed by increasing the certainty of meeting the requested delivery schedule throughout the year to south-of-Delta contractors dependent on San Luis Reservoir, increasing the reliability and quantity of yearly allocations to south-of-Delta contractors dependent on San Luis Reservoir, and announcing higher allocations earlier in the season to south-of Delta contractors dependent on San Luis Reservoir without sacrificing accuracy of the allocation forecasts.	Water supply project	Draft Feasibility Report published April 2019. Construction expected to begin in 2024 and be completed in 2029.	Hydrology and water resources, biological resources	San Luis Reservoir in Merced County
18	San Luis Reservoir Seismic Retrofit: B.F. Sisk Dam[95]	Structural and operational modifications to B.F. Sisk Dam that would prevent destabilization of the dam embankment, reduce safety concern, and maintain water supply deliveries to state and federal water contractors during a seismic event.	Water supply project	Construction anticipated to begin summer 2021	Hydrology and water resources, geology, soils, and seismicity, traffic and transportation, air quality and GCC, biological resources, noise	B.F. Sisk Dam is located on the west side of California's Central Valley between Los Banos and Gilroy.

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts (if available)	Location
19	B.F. Sisk Dam Safety of Dams Modification Project[96]	The project includes the addition of shear keys and downstream stability berms and raises the dam crest by 12 feet to provide seismic stability for the embankment during a large earthquake. This alternative reduces risk significantly below Public Protection Guidelines and provides the most confidence of any alternative in the estimate of risk reduction.	Dam project	ROD signed in December 2019 Construction began September 2020 and is anticipated to be complete in December 2028	Water resources, geology, soils, and seismicity	San Luis Reservoir, an offstream storage facility located on San Luis Creek and Cottonwood Creek approximately 12 miles west of Los Banos, California
20	B.F. Sisk Dam Raise and Reservoir Expansion Project[97]	The project involves raising the Sisk Dam 12 feet to increase storage capacity in San Luis Reservoir to provide greater operational flexibility and water supply reliability for South-of-Delta CVP and SWP water contractors. Increased capacity and reserved supply within San Luis Reservoir would only be used to help meet existing demands and would not serve any new demands in the South-of-Delta CVP and SWP service areas.	Dam project	Draft EIR/Supplemental EIS published	Water resources, geology, soils, and seismicity	San Luis Reservoir, an offstream storage facility located on San Luis Creek and Cottonwood Creek approximately 12 miles west of Los Banos, California

CUP = conditional use permit
CVP = Central Valley Project
EIR = environmental impact report

APPENDIX 3.19-B: CUMULATIVE TRANSPORTATION PROJECTS LISTS

Since publication of the Draft Environmental Impact Report/Environmental Impact Statement, the following substantive changes have been made to this appendix:

- The status of cumulative transportation projects was updated.

Table 1 Santa Clara County Transportation Plans and Projects List

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts	Location
1	California High-Speed Rail Project, San Francisco to San Jose Section	Construction of high-speed rail alignment connecting the Transbay Transit Center in San Francisco to San Jose Diridon Station	New transportation facility (high-speed rail)	Environmental review in progress	Noise and Vibration, Aesthetics, Cultural Resources, Transportation	San Francisco, San Mateo County, Brisbane, South San Francisco, San Bruno, Millbrae, Burlingame, San Mateo, Belmont, San Carlos, Redwood City, Menlo Park, Santa Clara County, Palo Alto, Mountain View, Sunnyvale, Santa Clara, San Jose
2	Santa Clara Valley Transportation Authority VTP2040: The Long-Range Transportation Plan for Santa Clara County[1]	VTP 2040 is the long-range transportation plan for Santa Clara County. VTP 2040 provides a framework for the development and maintenance of VTA's transportation system, including policy guidance and identifies programs and projects for all travel modes, over the next 25 years.	Transportation Plan	Adopted 2014	N/A	Santa Clara County
3	Metropolitan Transportation Commission Transportation Improvement Program 2017[2]	Comprehensive four-year regional plan, required by federal law, which includes major regional state- and locally-funded projects, as well as all transportation programs and projects expected to require any action by a federal agency. Types of projects covered by the TIP include highways, bridges, local streets and roads, transit, bicycle, pedestrian, and freight movement projects.	Transportation Plan	Adopted November, 2016	N/A	Nine-county San Francisco Bay Area region: Alameda, Contra Costa, Marin, Napa, Santa Clara, San Francisco, San Mateo, and Solano
4	Plan Bay Area[3]	Plan Bay Area is a long-range plan combining the Bay Area's Regional Transportation Plan and Sustainable Communities Strategy. Plan Bay Area provides a strategy for meeting the region's anticipated future housing needs through the use of Priority Development Areas (PDAs) within walking distance of transit and other amenities.	Regional Transportation Plan/Sustainable Communities Strategy	Adopted 2013	Agricultural and forest resources; air quality; biological resources; cultural resources; hazards; land use; noise; public services and recreation; public utilities and facilities; sea level rise flooding; transportation; visual resources	Nine-county San Francisco Bay Area region: Alameda, Contra Costa, Marin, Napa, Santa Clara, San Francisco, San Mateo, and Solano
5	VTA Bus Rapid Transit Strategic Plan[4]	The BRT Strategic Plan provides policy direction and establishes a framework for implementation of a countywide BRT network.	Transportation plan	Adopted 2009	N/A	Santa Clara County
6	Capitol Expressway LRT Extension-Phase 2[5]	Extension of light rail from the existing Alum Rock Light Rail Station to the Eastridge Transit Center. Light rail will operate primarily in the center of Capitol Expressway, with elevated track structures crossing Capitol Avenue, Story Road, and Tully Road, and new LRT stations at Story Road (aerial), Ocala (optional), and Eastridge (at-grade).	Transit expansion	Final second addendum to Final SEIR-2 published January 2020; construction 2021 through 2025	None	Capitol Expressway from Alum Rock LRT station to new Eastridge Transit Center

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts	Location
7	LRT Extension Winchester Station to Vasona Junction[6]	A 1.6-mile extension of the existing Mountain View to Winchester line from the Winchester Station in Campbell to Los Gatos. The project would be implemented in two phases based on funding and projected ridership. Phase 1 would include construction of a double set of light rail tracks at the existing Winchester Station, expansion of parking capacity at the Winchester Station, construction of a new Vasona Junction Station with a Park & Ride lot and end-of-the-line facilities, and lengthening of six existing station platforms along the Vasona Corridor alignment (Winchester, Campbell, Hamilton, Bascom, Fruitdale, and Race) to accommodate longer trains. Phase 2 would consist of construction of a new Hacienda Light Rail Station with an optional Park & Ride lot.	Transit expansion	RFP issued in August 2017; VTA Board awarded conceptual study contract in May 2018; conceptual study completed June 2019.	None identified in SEIR/EA	Campbell and Los Gatos, Santa Clara County
8	Stevens Creek Corridor BRT Improvements[7]	Provision of bus rapid transit service, in addition to the existing local route, for 8.5 miles from De Anza College to the Transit Mall in downtown San Jose using San Carlos Avenue and Stevens Creek Boulevard.	Transit improvements	Complete		San Jose and Cupertino
9	Light Rail Track Crossovers and Switches[8]	Installation of track crossovers and power switches at several locations along the existing LRT corridors to improve trackway maintenance and increase operational flexibility.	Transit improvements	Complete	N/A	Santa Clara County
10	ACE*forward*[9]	Near-term and longer-term improvements including increased service to 6 daily round-trips by 2019 and 10 daily round-trips by 2023), safety improvements such as grade crossings and additional track in key locations, and extension of ACE service to Manteca, Modesto, Turlock, and Merced, and is investigating potential stations in West Tracy, downtown Tracy, Ripon, Ceres, Livingston or Atwater, and a new Lathrop station at River Islands or a new Lathrop/Manteca stations location on the existing line.	Transit expansion and improvements	Environmental review suspended in 2017; no date for completion of environmental review; no funding obtained to date.	Aesthetics, biological resources, land use, noise, transportation	Alameda, Santa Clara, Merced, San Joaquin, Stanislaus counties
11	Capitol Corridor Joint Powers Authority Oakland to San Jose Phase 2 Double Track (Segment 2A)[10]	Construct a second mainline track, platforms and modifications to existing tracks between the cities of Oakland and San Jose, on the Union Pacific Railroad (UPRR).	Transit improvements	Environmental review of Oakland – Newark expected in 2019 - 2021. Construction timing TBD. Timing for environmental review and funding of Newark to San Jose uncertain.	N/A	Between the cities of Oakland and San Jose, on the Union Pacific Railroad (UPRR) Niles subdivision from Mile Post (MP) 6 to MP 35, and the Coast subdivision MP 13 to MP 35, and on the Caltrain Right of Way MP 44 to MP 48.
12	Mineta San Jose International Airport People Mover[11]	Dedicated guideway connection from the San Jose International Airport to the Caltrain, BRT, and future BART stations at the Santa Clara Transit Center and the VTA LRT on North First Street.	Transit expansion and improvements	Conceptual technology analysis completed; conceptual alternatives analysis 2017-2018; RFI issued July 2019	N/A	San Jose and Santa Clara

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts	Location
13	I-680 Northbound HOV/HOT lane from SR 237 in Santa Clara County to SR 84 in Alameda County[12]	Addition of a carpool/express lane in the northbound direction on I-680 from south of State Route 237 (SR 237) to north of SR 84 (approximately 15 miles), within Santa Clara and Alameda Counties in and near the cities of Milpitas, Fremont, Pleasanton, and the community of Sunol. The project will increase the efficiency of the transportation system by expanding and optimizing freeway capacity to reduce congestion and accommodate existing and future travel demands.	Express lane construction	Under construction	None identified.	Santa Clara and Alameda counties; in or near the cities of Milpitas, Fremont, and Pleasanton, and the community of Sunol.
14	SR 85 Express Lanes and Auxiliary Lane, I-280 to SR 87[13]	Conversion of existing HOV lanes on SR 85 to express lanes and addition of second express lane in both directions between SR 87 and I-280.	Express lane and auxiliary lane construction	Under construction; anticipated operation in fall 2021	None	Santa Clara County, San Jose, Cupertino, Campbell
15	US 101/Montague Expressway Interchange[14]	Construction of interchange at US 101 and Montague Expressway.	New interchange construction	Conceptual	N/A	Santa Clara
16	US 101 Express Lane Conversion, San Mateo/Santa Clara County Line to Cochrane Road[15]	Conversion of existing northbound and southbound high occupancy vehicle (HOV) lanes (a single lane in each direction) to high occupancy toll (HOT) lanes (express lanes), widening the freeway to add a second express lane in both directions from Cochrane Road in Morgan Hill to SR 85 in San Jose, and from Blossom Hill Road in San Jose to North Fair Oaks Avenue in Sunnyvale to create a dual express lane facility in these segments. The Project would also convert the US 101/SR 85 HOV direct connectors in Mountain View to express lane connectors. Auxiliary lanes would be added in both directions on US 101 between Great America Parkway and Lawrence Expressway, in the northbound direction on US 101 between Lawrence Expressway and North Fair Oaks Avenue, and in the northbound direction on US 101 between Old Bayshore Highway and North First Street. The Project also proposes to add new retaining walls in several areas. The Project length is 36.55 miles on US 101 and 1.1 miles on SR 85, for a total of 37.65 miles.	Express lanes	Phase II under construction	None	Santa Clara County from Palo Alto to Morgan Hill
17	New SR 152 Alignment[16]	Construct new alignment of SR 152 from SR 156 to US 101 in Santa Clara and San Benito counties	New highway alignment	Not yet funded	N/A	San Benito and Santa Clara counties
18	State Route 237 Express Lanes Project[17]	Construction of new HOV/express lanes to extend the length of the SR 237 express lanes from North First Street to US 101 in Sunnyvale, in both directions.	HOV and express lanes	Complete		SR237 from North First Street in San Jose to US 101 in Sunnyvale
19	Central Expressway Improvements[18]	Provision of auxiliary lanes from Lawrence Expressway to Mary Avenue and widening to six lanes from Lawrence Expressway to San Tomas Expressway. Possible HOV Lane conversion to general purpose lane, Central Expressway between San Tomas and De La Cruz.	Auxiliary lanes and widening	Construction began 2019		Santa Clara County

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts	Location
20	Montague Expressway Improvements[19]	Widening to 8 lanes Guadalupe River to Trade Zone Blvd (by San Jose), widening to 8 lanes Trade Zone to Great Mall and Great Mall to I-680, widening to 6 lanes I-680 to Park Victoria (includes widening of I-680 overpass), reconfiguring US 101/ Montague interchange, construction of Trimble flyover, construction of interchanges at McCarthy-O'Toole, Mission College, and Great Mall/Capitol Expressway, modification of I-680 interchange, and construction of Montague/US 101 and Montague/I-880 HOV direct connector ramps. Upcoming design for US 101/ Montague interchange improvements with at-grade improvements at Mission College, design study for I-680 interchange modifications, and installation of bicycle detection and implementation of bicycle adaptive signal timing.	Road widening and interchange improvements	Pending funding		Montague Expressway in Santa Clara County and San Jose
21	San Tomas Expressway Widening, El Camino Real to Williams Road[20]	Widen San Tomas Expressway from six to eight lanes between El Camino Real in the north and Williams Road in the south	Road widening	Complete		Santa Clara and San Jose
22	Isabel Bridge Replacement, San Antonio Valley Road[21]	Replacement of the Isabel Creek Bridge at San Antonio Valley Road with a new bridge on a new alignment meeting all current design standards	Bridge replacement and widening	Approved December 2016	None	Isabel Creek at San Antonio Valley Road
23	Santa Clara Caltrain Station Pedestrian Undercrossing[22]	VTA is currently building an extension to the current Santa Clara Station undercrossing and a new approach ramp, which will allow pedestrians and cyclists to access the Caltrain/ACE/Capitol Corridor platform and El Camino Real from Brokaw Road. Similar to a tunnel, the planned undercrossing extension will be approximately 80 feet long, and will run under three Union Pacific Railroad (UPRR) tracks. In conjunction with the planned underpass extension, an open-air ramp of approximately 250 feet long will connect Brokaw Road to the tunnel structure.	Extension of grade-separated pedestrian tunnel	Complete	None	Santa Clara
24	Caltrain Peninsula Corridor Electrification Project[23]	Electrification of the Caltrain corridor from the 4th and King station in San Francisco to approximately the Tamien Station in San Jose. Includes conversion of diesel-hauled trains to electric multiple unit (EMU) trains and increased service up to six trains per peak hour per direction.	Transit improvement	In construction; first electric trains expected to be in service in 2022.	Aesthetics; flooding and sea level rise; noise; transportation and traffic	Caltrain corridor from 4th and King streets in San Francisco to Tamien Station in San Jose
25	2008 Countywide Bicycle Plan[24]	Countywide plan that guides the development of major bicycling facilities by identifying Cross County Bicycle Corridors and other projects of countywide or intercity significance. The CBP complements Member Agencies' bicycle plans, which focus on improvements at the local level, and incorporates other regional bike projects including the Bay Trail and the Bay Area Ridge Trail.	Transportation plan	Adopted 2008		Santa Clara County
26	SR 87 HOV conversion, SR 85 to US 101[25]	Conversion of HOV lanes to express lanes	Express lanes	Design and engineering complete in summer 2021; construction anticipated summer 2021–2023		Santa Clara County
27	I-280 Express Lane Conversion[26]	Conversion of HOV lanes to express lanes, three segments: Magdalena Avenue to Leland Avenue, US 101 to Leland Avenue, and El Monte Road to Magdelena Avenue	Express lanes	Conceptual		Santa Clara County
28	Caltrain Double-Track, Segments between San Jose and Gilroy[27]	Installation of 8 miles of double tracking on the existing Union Pacific Railroad (UPRR) corridor between San Jose and Gilroy to increase Caltrain capacity.	Transit improvements	2021 completion		Santa Clara County

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts	Location
29	SR 237 Westbound to SR 85 Southbound Connector Ramp Widening and Improvements[28]	Improve SR 237 Westbound to SR 85 Southbound Connector Ramp Widening and Improvements and Southbound Auxiliary Lane Construction, SR 237 to SR 85/El Camino Real Interchange	Ramp improvements and auxiliary lane construction	Conceptual		Santa Clara County
30	Almaden Expressway Widening[29]	Almaden Expressway widening to 8 Lanes from Coleman Road to Blossom Hill Road and to 6 lanes from Camden Road to Redmond	Road widening	Under construction		Santa Clara County
31	Lawrence Expressway Widening[30]	Widening Lawrence Expressway from 6 to 8 lanes between Moorpark Avenue/Bollinger Road and south of Calvert Court	Road widening	Under construction		Santa Clara County
32	Lawrence Expressway Medians[31]	Modify medians on Lawrence Expressway, including those at Lochinvar Avenue, De Sota Avenue, Golden State Drive, Buckley Street and St. Lawrence Drive/Lawrence Station Road, for limited access	Road median reconfiguration	Under construction		Santa Clara County
33	Lawrence Expressway Grade Separation Project[32]	Study looking at the intersections at Reed Avenue/Monroe Street, Kifer Road, and Arques Avenue to address traffic congestion	New interchange	Final report published September 30, 2014		Santa Clara County
34	SR 85/Cottle Road Interchange[33]	Improve the SR 85/Cottle Road interchange	Interchange reconfiguration	Not yet funded		Santa Clara County
35	Capitol Expressway ITS and Bike/Pedestrian Improvements[34]	Installation of ITS infrastructure along Capitol Expressway from Excalibur Drive to SR 87 ramp providing for traffic responsive signal timing and adaptive bicycle and pedestrian signal timing, and fill in sidewalk gaps along Capitol Expressway.	Traffic operations improvements	Complete		Santa Clara County
36	Capitol Corridor Extension to Salinas[35]	Extension of passenger rail service from Santa Clara County south to Salinas with two daily round trips initially and up to six daily round trips at buildout between San Jose and Salinas. Kick-start phase includes a downsized Salinas station, track improvements in Gilroy to allow through-service and minor station improvements in Morgan Hill, Gilroy, and Tamien Stations.	Transit extension	February 2013, Principles of Agreement (POA) approved by TAMC and CCJPA for Salinas rail service to operate as a Capitol Corridor extension, with two daily round trips beginning in 2019-2020 assuming infrastructure improvements are completed and operating funds are secured, and dependent on the expansion of existing Capitol Corridor service to San Jose. Construction anticipated in 2020	None	Gilroy, Santa Clara County, San Benito County, Monterey County, Pajaro, Castroville, Salinas

Table 2 City of San Jose Transportation Projects List

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts	Location
1	BART Silicon Valley Extension[36]	Two-phase project extending BART service to Silicon Valley. Phase I includes the 10-mile, two-station Berryessa Extension. Phase II includes a 5-mile-long subway tunnel through downtown San Jose and will extend the BART system from the planned Berryessa Extension terminus for approximately six miles, ending at-grade in Santa Clara near the Caltrain Station.	Transit expansion	Phase I operational June 2020; Phase II in design and engineering, anticipated operation by 2035	Air quality, greenhouse gases, noise, transportation and traffic	San Jose
2	Parking Capital Program[37]	Program focused on projects that will adequately maintain the City's parking facilities in a safe and operational manner, upgrade the Revenue Control System within key garages, expand meter upgrade to Smart Meters, support LED lighting and security program upgrades, provide for multi-modal improvement projects in the greater Downtown and Diridon Areas, provide for temporary parking facilities to support SAP Center events to mitigate the loss of existing parking due to pending development, and provide preliminary evaluation and planning for a parking garage to serve the greater Downtown Area. Major projects include: arena area parking development; downtown event parking dynamic message sign; greater downtown area multi-modal/streetscape improvements; and greater downtown parking garage.	Parking and transit improvement program	2020–2024		San Jose
3	Construct US 101/Mabury Road/Taylor Street Interchange[38]	Construction of new interchange at US 101/Mabury Road/Taylor Street in San Jose	New interchange	Complete		San Jose
4	US 101/Blossom Hill Road Interchange Improvement Project[39]	Project includes installation of a bicycle/pedestrian path from Monterey Road to the Coyote Creek Trail, construction of a bridge structure over US 101 between two existing Blossom Hill Road bridge decks to accommodate the addition of one lane in each direction, and modification of US 101 northbound and southbound on/off ramps	Interchange improvements including a bridge over US 101	Out for bid in May 2020		San Jose
5	I-680 Soundwalls from Capitol Expressway to Mueller Avenue	Construction of new soundwalls along I-680 between Capitol Expressway and Mueller Avenue in San Jose	Soundwall construction	Soundwall design and construction planned for FY 2020–2021		San Jose
6	Extend Charcot Avenue over I-880	Construction of a new 2-lane east/west connection of Charcot Avenue over I-880, extending the existing Charcot Avenue approximately 0.25 mile, with bicycle and pedestrian improvements to connect to North San Jose employment center	Road extension	Final EIS and NOD published in June 2020		San Jose
7	US 101/Buena Vista Avenue Interchange	Construction of a new freeway interchange at US 101 and Buena Vista Avenue in San Jose	New interchange	Conceptual		San Jose
8	Coleman Avenue Widening	Widening of Coleman Avenue from 4 to 6 lanes from I-880 to Taylor Street	Road widening	Complete		San Jose
9	Snell Avenue Widening[40]	Widening of Snell Avenue from Branham Lane to Chynoweth Avenue	Road widening	Complete		San Jose
10	Branham Lane Widening[41]	Widening of Branham Lane from Vista Park Drive to Snell Avenue (includes bicycle and pedestrian facilities	Road widening	Funded in May 2019		San Jose
11	Autumn Parkway	Extension of Autumn Parkway from Julian Street to San Carlos Street	Road widening, partial realignment, and extension	Complete		San Jose

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts	Location
12	US 101 Zanker Road/North 4th Street/Skyport Drive Interchange Improvements[42]	Construction of a new interchange connecting Zanker Road and Old Bayshore Highway with North 4th Street and Skyport Drive on US 101 in San Jose. Proposed improvements include: •constructing a new interchange and overcrossing bridge across US 101 to connect Zanker Road and Old Bayshore Highway with North 4th Street and Skyport Drive; modifying existing on- and off-ramps at North 1st Street/E. Brokaw, North 4th Street and Old Bayshore Highway; modifying existing local street intersections in the area; and constructing retaining walls as needed.	Interchange improvements, addition of connection between Zanker Road and Skyport Drive and Fourth Street	Project approved; construction anticipated to be complete 2021		San Jose
13	Bay Trail Reach 9 & 9B[43]	Development of Reach 9 and 9B of the Bay Trail to permit travel from downtown San Jose to Sunnyvale and western reaches of the Bay Trail along existing, paved trails	Pedestrian improvements	Pending funding		San Jose
14	St. John Street Multi-Modal Improvements - Phase 1[44]	Pedestrian and bicycle improvements on St. John Street	Pedestrian and bicycle improvements	Complete		San Jose
15	San Jose Bike Plan 2020[45]		Transportation plan	Adopted November, 2009		San Jose

Table 3 City of Morgan Hill Transportation Projects List

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts	Location
1	Hale Avenue Extension[46]	The proposed roadway project would be constructed in two phases, Phase I and Phase II. Phase I is the extension of Hale Avenue from West Main Avenue to the Dewitt/Spring Avenue intersection. Phase II is the realignment and widening of the Santa Teresa Corridor from the Dewitt/Spring Avenue intersection to Watsonville Road.	Road extension	Construction anticipated fall 2020 pending funding	None	Phase I is entirely within Morgan Hill; half of Phase II is in unincorporated Santa Clara County
4	US 101 Express Lanes Project Phase 4[47]	Conversion of 36 miles of US 101 to express lanes and add a second express lane for the majority of the corridor from Dunne Avenue in Morgan Hill to the San Mateo County line. The second express lane will provide a two-lane facility within urbanized segments. The US 101 express lanes will connect with the SR 85 express lanes in San Jose and convert US 101/SR 85 HOV direct connectors in Mountain View to express lane connectors.	Express lane construction	Construction anticipated summer 2021–2023		Morgan Hill
5	US 101/Tennant Avenue Interchange Improvements	Interchange expansion and reconfiguration and road widening at US 101/Tennant Avenue interchange.	Interchange improvements	Conceptual		Morgan Hill

IS = Initial Study
EA – Environmental Assessment

Table 4 City of Gilroy Transportation Projects List

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts	Location
6	Capitol Corridor Extension to Salinas[48]	Extension of passenger rail service from Santa Clara County south to Salinas with two daily round trips initially and up to six daily round trips at buildout between San Jose and Salinas. Kick-start phase includes a downsized Salinas station, track improvements in Gilroy to allow through-service and minor station improvements in Morgan Hill, Gilroy, and Tamien Stations.	Transit extension	February 2013, Principles of Agreement (POA) approved by TAMC and CCJPA for Salinas rail service to operate as a Capitol Corridor extension, with two daily round trips beginning in 2019–2020 assuming infrastructure improvements are completed and operating funds are secured, and dependent on the expansion of existing Capitol Corridor service to San Jose. Construction anticipated in 2020	None	Gilroy, Santa Clara County, San Benito County, Monterey County, Pajaro, Castroville, Salinas
7	SR 152/Frazier Lake Road Intersection[49]	Improve ramp/intersection on SR 152 eastbound at Frazier Lake Road by installation of traffic signals, construction of a right lane and installation of advance warning signs.	Road reconfiguration	Complete		Gilroy
8	Ballybunion at Santa Teresa[50]	Construction of new bridge as part of road extension.	Intersection improvement	Complete		Gilroy
9	Cameron at Princeville Channel[51]	Construction of new bridge as part of road extension.	Bridge project	Complete		Gilroy
10	Cameron and Luchessa Intersection[52]	Construction of new intersection.	Intersection improvement	Construction anticipated for FY 2020–2021		Gilroy
11	Cohansey at Church[53]	Construction of new intersection.	Intersection improvement	Complete		Gilroy
12	Cohansey at Monterey Road Improvements[54]	Road improvements.	Road improvements	2020 to 2021		Gilroy
13	Gourmet Alley Pedestrian Enhancements[55]	Pedestrian improvements.	Pedestrian improvements	Complete		Gilroy
14	Kern at Welburn[56]	Construction of new intersection.	Intersection improvement	Complete		Gilroy
15	Las Animas Avenue Overcrossing at US 101	Construction of new overcrossing.	Construction of new overcrossing	Complete		Gilroy

Table 6 Merced County Transportation Projects List

ID No.	Project Name	Description	Project Type	Status/Timing	Potential significant unavoidable impacts	Location
1	California High-Speed Rail Project, Merced to Fresno Section[81]	Construction of high-speed rail alignment connecting Merced Station to Fresno Station.	New transportation facility (high-speed rail)	Under construction	Agricultural Lands, Noise and Vibration, Parks, Recreation and Open Space, Aesthetics and Visual Resources, Cultural and Paleontological Resources, Cumulative	Merced County, Madera County, City of Chowchilla, City of Madera Acres, City of Fresno
2	California High-Speed Rail Project, Central Valley Wye[82]	Construction of high-speed rail junction connecting trains to and from Gilroy, Merced, and Fresno	New transportation facility (high-speed rail)	Supplemental Environmental Studies pending		Merced County, Madera County, City of Chowchilla
3	Merced County 2018 Regional Transportation Plan[83]	County-wide planning document which provides the framework for transportation infrastructure investments in the county for the next 25 years. Provides a plan to comply with SB375 to reduce GHG. (MCAG 2014)	Transportation Plan	Adopted August 16, 2018	Air Quality and Global Climate Change, Transportation and Circulation, and Land Use	Merced County
4	Livingston Northbound Median Widening Project[84]	Construction of one freeway lane within the median in the northbound direction on SR-99, beginning just south of the Hammatt Avenue Overcrossing, and ending just past the Merced/Stanislaus County line in Merced County.	Median, road widening	Under construction, complete in spring 2021	Land Use, Air Quality, Noise and Vibration, Natural Communities, Wetlands, Animal Species, Threatened and Endangered Species, Traffic and Transportation and Construction	SR 99 between Hammatt Avenue and the Stanislaus/Merced County Line
5	Livingston Southbound Median Widening Project[85]	Construction of one freeway lane within the median in the southbound direction on SR-99, beginning just south of Hammatt Avenue Overcrossing, and ending just past the Merced/Stanislaus County line in Merced County	Median, road widening	Construction anticipated summer 2022, complete in winter 2024	Land Use, Air Quality, Noise and Vibration, Natural Communities, Wetlands, Animal Species, Threatened and Endangered Species, Traffic and Transportation and Construction	SR 99 between Hammatt Avenue and the Stanislaus/Merced County Line
6	SR 99 Hilmar-Turlock Interchange and Bypass[86]	Construct new interchange between Bradbury Road and SR 165, serving Hilmar/Turlock region. Construct an alternative route around Hilmar with connection to new interchange.	New interchange	Construction pending Project Initiation Document approval	Land Use, Air Quality, Noise and Vibration, Natural Communities, Animal Species, Traffic and Transportation and Construction	SR 99: Bradbury Road and Highway 165
7	SR 152 Los Banos Bypass Phase1[87]	Construction of a new 4 lane expressway bypassing the City of Los Banos to relieve inner-city congestion and improve flow of interregional traffic.	New freeway bypass	Final EIR June 2007; funding approved in May 2019	Land Use, Air Quality, Noise and Vibration, Natural Communities, Animal Species, Traffic and Transportation and Construction	Between SR-165 and will tie-in with existing SR-152 signalized I/S in Los Banos from SR165 to SR-152 near Santa Fe Rd. Merced County
8	SR 152 Los Banos Bypass Segment 2	Construction of a new 4 lane expressway bypassing the city of Los Banos, from West of Volta Road to SR 165 south of Henry Miller Road.	Construction of three interchanges	Final EIR June 2007; funding approved in May 2019	Land Use, Air Quality, Noise and Vibration, Natural Communities, Animal Species, Traffic and Transportation and Construction	Around the city of Los Banos between HWY 165 and W HWY 152 Merced County

APPENDIX 4-A: CONCURRENCE LETTER

CALIFORNIA
High-Speed Rail Authority
Northern California Regional Office

September 21, 2021

Jon Cicirelli, Director
City of San Jose Department of Parks, Recreation & Neighborhood Services
200 E. Santa Clara Street
San Jose, CA 95113

Dear Mr. Cicirelli:

On April 24, 2020, the California High-Speed Rail Authority (Authority) released a Draft Environmental Impact Report (EIR)/Environmental Impact Statement (EIS) for the San Jose to Merced Project Section of the statewide California High-Speed Rail (HSR) System in accordance with the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). This Draft EIR/EIS documents engineering, environmental analysis, public and agency involvement, and ensuring compliance with state and federal environmental laws and regulations for the proposed project. One federal law, Section 4(f), is the subject of this concurrence request. The Draft EIR/EIS also detailed preliminary determinations for Fuller Park, a Section 4(f) resource located in the City of San Jose. The Authority is currently preparing an Administrative Final EIR/EIS, which includes responses to comments received on the Draft EIR/EIS (including those received from the city) and updated Section 4(f) evaluations.

In addition, on July 10, 2020, the Authority released a Draft EIR/EIS for the San Francisco to San Jose Project Section of the California HSR System also in accordance with CEQA and NEPA. The San Francisco to San Jose Project Section alternatives are divided into geographic subsections. The fifth subsection is the San Jose Diridon Station Approach Subsection between Scott Boulevard in Santa Clara and West Alma Avenue in San Jose. To support a station-to-station analysis with logical termini for the San Francisco to San Jose Project Section, the analysis of the San Jose Diridon Station Approach Subsection was incorporated into San Francisco to San Jose Project Section Draft EIR/EIS. The San Jose Diridon Station Approach Subsection was fully analyzed as part of the San Jose to Merced Project Section Draft EIR/EIS and corresponding technical reports. As a result of incorporating the subsection analysis in both project sections, Section 4(f) resources including Fuller Park in the City of San Jose, are also included in the San Francisco to San Jose Project Section Draft EIR/EIS analysis.

The Authority's Preferred Alternative for the San Jose to Merced Project Section is Alternative 4, which is the same as Alternative A for the San Francisco to San Jose Project Section in the San Jose Diridon Station Approach Subsection. Alternative A is the Authority's Preferred Alternative for that project section. Thus, the Section 4(f) findings under both project sections for each resource are the same, and the Authority is requesting concurrence from the City for these resources for both project sections.

Section 4(f) of the United States Department of Transportation Act of 1966, as amended, and codified in 49 United States Code (U.S.C.) Section 303, declares that "it is the policy of the United States Government that special effort should be made to preserve the natural beauty of the countryside and public park and recreation lands, wildlife and waterfowl refuges and historic sites." The Authority is responsible for Section 4(f) compliance for the HSR Program pursuant to 23 U.S.C. Section 237, under the NEPA Assignment Memorandum of Understanding (MOU) between the Federal Railroad Administration and the State of California, effective July 23, 2019, the Authority is the federal lead agency and is responsible for compliance with NEPA and other federal environmental laws, including Section 4(f) (49 U.S.C. § 303) and related U.S. Department of Transportation orders and guidance. In general, Section 4(f) specifies that the Authority may only approve a project that "uses" the resources mentioned above, if (1) there is no prudent and feasible alternative that avoids the use of Section 4(f) resources, and (2) the project includes all possible planning to minimize harm to those resources. In lieu of making these findings, the Authority also can approve the use of a Section 4(f) resource if it determines that the project will have a "*de minimis*" impact on that resource and the official with jurisdiction over the resource concurs in that determination. For parks, recreation areas, and refuges, the official with jurisdiction (OWJ) is the agency (or agencies) that owns or administers the property.

Additionally, the Authority may approve the temporary occupancy of a Section 4(f) property as minimal and not a use, if the "temporary occupancy" of the property meets the criteria under 23 U.S.C § 774.13(d): it would be of shorter duration than construction; there would be no change in ownership of the land; the scope of the work would be minor; there would be no temporary or permanent adverse changes to the activities, features, or attributes of the property; the property would be fully restored to a condition at least as good as it was prior to the project, that the temporary use would not interfere with the protected activities of the park; and the official with jurisdiction over the resource concurs in that determination.

The Authority has determined that Fuller Park located within the City of San Jose is a Section 4(f) resource; is within the resource study areas of both project sections; and that your agency is the OWJ with respect to this resource. The purpose of this letter is to request concurrence with findings the Authority has made with respect to the *de minimis* finding for Fuller Park, and the minimal nature of the temporary occupancy for Fuller Park. The basis for these findings was originally detailed in Chapter 4, Section 4(f)/6(f) of the San Jose to Merced and San Francisco to San Jose Project Section Draft EIR/EISs[1] and which have been subsequently revised in the Administrative Final EIR/EISs for both project sections based on written and oral comments received on the

[1] Chapter 4, Section 4(f)/6(f), of the San Jose to Merced Project Section Draft EIR/EIS is available at the Authority's website: https://hsr.ca.gov/programs/environmental/eis_eir/draft_san_jose_merced.aspx and Chapter 4, Section 4(f)/6(f), of the San Francisco to San Jose Project Section Draft EIR/EIS is available at: https://hsr.ca.gov/programs/environmental-planning/project-section-environmental-documents-tier-2/san-francisco-to-san-jose-project-section-draft-environmental-impact-report-environmental-impact-statement/.

April 2020 and July 2020 Draft EIR/EISs. A summary of the Authority's findings is set forth below. As noted, the Authority's Preferred Alternative is Alternative 4 for San Jose to Merced and Alternative A for San Francisco to San Jose, which is the same for both project sections in the San Jose Diridon Station Approach Subsection. For simplicity, in the following discussions, references to findings for the Preferred Alternative apply to and are the same for both project sections.

Fuller Park *De Minimis* and Temporary Occupancy Exception Findings

The Preferred Alternative would be at grade and on an embankment adjacent to the park, permanently affecting 0.03 acre (2.6 percent) of the park as shown on Figure 1. The area permanently affected would be acquired by the Authority and includes 0.02 acre currently used for UPRR operations located west of Delmas Avenue. The 0.02 acre contains the existing train control site and an unpaved access road from Fuller Avenue. The Preferred Alternative would shift the existing site approximately 20 feet west and provide a new access road from Fuller Avenue. The Authority would also use this area for a train control site. This permanent easement would maintain public passage when not in use for service vehicles or maintenance of the train control site. This portion of the park does not contain any recreational facilities and is currently used for train operations. East of Delmas Avenue, 0.01 acre of the park adjacent to the current Caltrain right-of-way would be incorporated into the HSR right-of-way. This area is on the northeastern edge of the park, directly adjacent to the existing right-of-way, and does not contain any recreational facilities (Figure 1).

Preferred Alternative construction in these areas would not require closure of the park and the park would remain open for continued use during construction and operations. Access to the park from Fuller Street would not be temporarily or permanently affected. Existing vegetation and/or landscaping within the construction area would be temporarily disturbed, but the affected portions would be restored to pre-construction conditions. Prior to any ground-disturbing activities at the park, a restoration plan would be prepared by the Authority addressing specific actions, sequence of implementation, parties responsible for implementation, and successful achievement of restoration for temporary impacts, such as replanting trees and vegetation that would be removed. Before beginning construction, the contractor would submit the restoration plan for review and obtain Authority approval. The Authority would provide the restoration plan to the City of San Jose Department of Parks, Recreation & Neighborhood Services for review and comment before implementation.

Also, east of Delmas Avenue, another 0.01 acre would be used as an access temporary construction easement (TCE). This area is also on the northeastern edge of the park adjacent to the existing right-of-way and does not contain any recreational facilities (Figure 1). The Authority has determined that the temporary occupancy of Fuller Park under the Preferred Alternative meets the criteria for temporary occupancy that are so minimal so as to not constitute a use (i.e., occupancy would be of shorter duration than construction; there would be no change in ownership of the land; scope of the work would be minor such that both the nature and magnitude of changes to the Section 4(f)

The permanent and temporary occupancy impacts under the Preferred Alternative on Fuller Park would not adversely affect the protected activities, features, or attributes that qualify the park for protection under Section 4(f). Therefore, with the City of San Jose Department of Parks, Recreation & Neighborhood Service's concurrence, the Authority has concluded that the permanent impacts on Fuller Park under the Preferred Alternative would be *de minimis* and intends to approve the determination that the temporary occupancy exception meets the criteria for a temporary occupancy that is "so minimal so as to not constitute a use" pursuant to 23 C.F.R. 774.13(d).

Based on the information set forth above, the Authority has determined that the Preferred Alternative would not adversely affect or otherwise restrict the public's use of the trail or park, nor would it adversely affect the features, attributes, or activities that make the resources eligible for Section 4(f) protection. The Authority seeks your concurrence in this determination. A concurrence clause is provided at the end of this letter for this purpose.

We respectfully request your reply to this matter within 30 days of receipt of this letter. We look forward to continuing our successful working relationship with you as we work to deliver the nation's first HSR project.

Please return a scanned copy of this letter by email to Brett.Rushing@hsr.ca.gov.

Sincerely,

Brett Rushing
Supervising Environmental Planner
Brett.Rushing@hsr.ca.gov

CONCURRENCE:

Based on the information set forth in this letter and on the documents referenced herein, the City of San Jose Department of Parks, Recreation & Neighborhood Services concurs with the Authority's determinations that the San Jose to Merced Project Section and the San Francisco to San Jose Project Section would not adversely affect the activities, features, or attributes that make Fuller Park eligible for Section 4(f) protection. Therefore, the City of San Jose Department of Parks, Recreation & Neighborhood Services concurs in the Authority's determinations that the San Jose to Merced Project Section as well as the San Francisco to San Jose Project Section, would have *de minimis* impact on Fuller Park, and that the temporary occupancy of Fuller Park would be so minimal so as to not constitute a use in accordance with Section 4(f) of the U.S. Department of Transportation Act of 1966.

09/28/2021

Jon Cicirelli, Director
City of San Jose Department of Parks,
Recreation & Neighborhood Services

Date

Note: The Authority's Preferred Alternative (Alternative 4 and Alternative A) are the same for the San Jose to Merced Project Section and the San Francisco to San Jose Project Section, respectively in the San Jose Diridon Station Approach Subsection.

1 HIGH-SPEED RAIL AND ENVIRONMENTAL JUSTICE

In compliance with U.S. Presidential Executive Order (USEO) 12898 *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations,* requiring the avoidance or mitigation of disproportional health and environmental effects on environmental justice populations, the California High-Speed Rail Authority (Authority) develops environmental justice outreach plans for each High Speed Rail (HSR) Project Section. Title VI of the Civil Rights Act of 1964, as amended, states that "no person in the United States shall, on the grounds of race, color, or national origin, be excluded from participation in, be denied the benefit of, or be subjected to discrimination under any program or activity that receives Federal financial assistance." Environmental justice, as mandated by USEO 12898, falls under the umbrella of Title VI. USEO 12898 states that "each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations in the United States." USEO 12898 has been adopted as a planning process requirement for all Authority efforts (Authority 2016).

The Authority's definition and application of the term "environmental justice" as it relates to the HSR system is as follows:

> *"Environmental Justice (EJ) is the fair treatment of people of all races, cultures, and income with respect to the development, adoption, implementation and enforcement of environmental laws and policies. Implementation of environmental justice principles in how the Authority plans, designs, and delivers the high-speed rail projects means that [the Authority] recognizes the potential social and environmental impacts that project activities may have on certain segments of the public. [The Authority] recognizes how important provisions of existing environmental, civil rights, civil, and criminal laws may be used to help reduce environmental impact in all communities and environmental justice on the human element. The Authority has included environmental justice considerations in its planning for the statewide high-speed train system since 2000, when it commenced a programmatic environmental review process"* (Authority 2015).

1.1 Overview

This *Environmental Justice Outreach Plan* is prepared to support the environmental study for the San Jose to Merced Project Section (Project Section) of the California HSR program. It is intended to guide the Authority[1] in engaging low-income and minority populations in the resource study area (RSA)[2] to communicate project information, listen to and respond to community thoughts and concerns, and identify potential actions to mitigate any disproportionately high and adverse human health and environmental effects, including social and economic effects, on low-income and minority populations.

The *San Jose to Merced Project Section Draft EIR/EIS* will be a stand-alone, second-tier, project environmental document. The report focuses on the portion of the Project Section between San Jose and Carlucci Road (San Jose to Central Valley Wye project extent, or simply project extent). The San Jose to Central Valley Wye project extent has a length of approximately 91 miles. Beginning at Scott Road, north of San Jose Diridon Station, the corridor primarily follows Monterey Road, U.S. 101, and SR 152 through Pacheco Pass. Desktop research, field surveys, and impact analyses in resource-specific technical reports for this project extent would terminate at Carlucci Road. The Draft EIR/EIS will summarize and include the analysis in the Central Valley Wye Project Section and the Ranch Road Re-examination to extend the corridor to Merced.

The infrastructure and systems of the HSR system would consist of trains (rolling stock), tracks, stations, train control, power systems, and maintenance facilities. The design includes a double-track rail system to accommodate planned project operational needs for uninterrupted rail movement. The system would be

[1] In the context of this plan, *Authority* refers to the California High-Speed Rail Authority or its consultants.

[2] The San Jose to Merced Project Section extends from Scott Boulevard in Santa Clara on the Caltrain Corridor to Carlucci Road and Henry Miller Road in central San Joaquin Valley, northeast of Los Banos. The resource study area (RSA) for environmental justice is concurrent with this area. See Figure 1 for a map of the RSA.

grade-separated from all other transportation systems, with two exceptions: the at-grade alternative at Auzerais Avenue and the at-grade alternative at Virginia Street, both in the San Jose Diridon Station Subsection.

The conceptual design of the station areas (Santa Clara, Diridon, and Gilroy) provides connectivity for different types of transit, drop-off facilities, an entry plaza, a station house area for ticketing and support services, an indoor station room where passengers wait and access the HSR, and parking facilities. Station design has not progressed beyond the conceptual stage, but two locations have been identified near Gilroy to accommodate two proposed corridor alignments. One co-located light maintenance facility (LMF)/maintenance of infrastructure facility (MOIF) would be located in the Gilroy area, and a maintenance of wayside (MOWS) would be located west of Turner Springs Road in the Central Valley.

Surveys and environmental assessments of the San Jose to Merced Project Section were initiated in 2010, and administrative draft reports were completed; however, work on the Project Section was suspended prior to completing the technical reports and the administrative Draft EIR/EIS. Since that time, the Authority has continued to refine the alternatives and limits of construction for this Project Section. The Authority identified the project footprint in summer 2016. From this footprint, the Authority has developed a concise project definition. Technical analysis, station design, and outreach was ongoing through 2016 and the EIR/EIS analysis is underway.

The Authority requires that an environmental justice outreach plan be developed and implemented as part of the Draft EIR. This *Environmental Justice Outreach Plan* provides the following information:

- Summarizes demographics in the RSA and community groups that are stakeholders in the project.
- Describes the strategy for reaching out to, engaging, and gathering input from low-income and minority populations.
- Identifies the specific methods that will be used to implement this strategy, such as digital media, information booths, and presentations to and listening posts with environmental justice advocacy and community groups.
- Lists the documents that will be prepared to document the environmental justice outreach efforts.

The process and guidelines described in this plan are provide a consistent method for sharing information with low-income and minority populations during the environmental review process for this project extent.

1.2 Regulatory Setting

The Authority has a strong commitment to ensuring that no person shall, on the grounds of race, color, national origin, sex, age or disability be excluded from participation in, be denied the benefits of, or be otherwise subjected to discrimination under any program or activity in the design, construction and operation of the high-speed rail system. Accordingly, the Authority adopted a Title VI programmatic policy that pays careful attention to the needs of limited English proficiency (LEP) and environmental justice populations (Authority 2016).

The following text details additional applicable regulations, requirements, and federal efforts that govern and inform the development and implementation of an environmental justice outreach plan.

1.2.1 U.S. Presidential Executive Order 12898

According to USEO 12898 Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, projects that receive federal funding should “ensure the full and fair participation by all potentially affected communities in the decision-making process; to avoid/mitigate disproportionately high human health or environmental effects, including social and economic effects, on low-income and minority populations; to prevent the denial of, reduction in, or significant delay in the receipt of benefit by minority populations and low-income populations.” Environmental justice populations, as identified by USEO 12898, comprise Black, Asian American, Native American, Hispanic/Latino (regardless of race), and low-income persons.

To emphasize the importance of USEO 12898, the Obama Administration facilitated a multi-agency signing of the Memorandum of Understanding on Environmental Justice and USEO 12898 in 2011

(Environmental Justice MOU). On the 20th anniversary of the original executive order, President Obama issued a Presidential Proclamation further solidifying the Administration's commitment to environmental justice. The document states that communities historically burdened by pollution—particularly minority, low income and tribal communities—merit protection from environmental and health hazards, access to the federal decision-making process, and access to a healthy environment in which to live, learn, and work. The environmental justice MOU increases federal agency accountability to environmental justice populations and outlines processes to aid overburdened communities and facilitate community engagement in agency decisions.

1.2.2 U.S. Presidential Executive Order 13166

In 2000, President Clinton issued USEO 13166, which provided additional federal guidance about providing information and services to LEP persons. Under USEO 13166, each federal agency is required to examine the services it provides and develop and implement a system by which LEP persons can meaningfully access those services consistent with, and without unduly burdening, the fundamental mission of the agency. Each federal agency must also work to ensure that recipients of federal financial assistance provide meaningful access to their LEP applicants and beneficiaries. To assist the agencies with this endeavor, the Department of Justice has issued general guidance on compliance standards that recipients must follow to ensure that the programs and activities they normally provide in English are accessible to LEP persons and do not discriminate on the basis of national origin in violation of Title VI of the Civil Rights Act of 1964, as amended, and its implementing regulations.

According to the December 2015 USEO 13166 accomplishment report (LEP.gov 2015), federal agencies continue to improve implementation of the USEO 13166 with new tools, training, and resources; stronger coordination; integrated use of data and technology; increased technical assistance; and improved outreach and education.

Accordingly, the Authority provides LEP access, at a minimum, to individuals who are representative of more than 5 percent of the population in California or the county in which the Authority is providing an activity or service.

1.2.3 U.S. Department of Transportation Order 5610.2(a)

The U.S. Department of Transportation (USDOT) Order 5610.2(a) is used by USDOT to comply with USEO 12898. USDOT Order 5610.2 generally describes the process that the Office of the Secretary, and each operating administration within the USDOT, will use to incorporate environmental justice principles (as embodied in USEO 12898) into existing programs, policies, and activities. The order requires the Office of the Secretary, and each operating Administration within USDOT, to develop specific procedures to incorporate the goals of USDOT Order 5610.2 and USEO 12898 with the programs, policies, and activities that they administer or implement.

1.3 Project Section Demographics

For this Project Section, the Authority would provide HSR service between San Jose Diridon Station in downtown San Jose, to a Gilroy station in either downtown Gilroy or east of Gilroy, and a station in downtown Merced. The San Jose to Central Valley Wye project extent would connect San Jose to the Central Valley portion of the HSR system at the Central Valley Wye in Merced County, which in turn connects to the portion of the system running north to Merced and south to Fresno and southern California (Figure 1).

Because the portion of the Project Section between Merced and Carlucci Road has been analyzed in the *Merced to Fresno Section Final EIR/EIS* (Authority and FRA 2012) and the *Merced to Fresno Section: Central Valley Wye Draft Supplemental EIR/EIS* (Authority and FRA no date), the analysis in this document focuses on the project extent between Scott Boulevard and Carlucci Road (San Jose to Central Valley Wye project extent).

Source: Authority and FRA 2016 JULY 2017

Figure 1 Proposed San Jose to Merced Project Section

Based on the 2010-2014 American Community Survey 5-year estimates for Santa Clara, San Benito, and Merced counties, San Benito County had the highest Hispanic/Latino population of the three counties. In Gilroy, more than half of the population was Hispanic/Latino. In 2014, Morgan Hill and San Martin were predominantly white while Gilroy and San Jose had the largest minority populations—approximately 68.5 and 72.5 percent minority, respectively. Morgan Hill was the least racially and ethnically diverse city, with only 50.7 percent minority representation. Table 1 shows the ethnic composition of the three-county region in 2014.

Table 2 shows other regional characteristics regarding income, age, and households. To account for the high regional cost of living in Santa Clara County, the poverty level metric that defines low-income populations for Santa Clara County and its cities has been set at 200 percent of the federal poverty level. As a result, all of the cities identified in Table 2 have a higher rate of low-income individuals than the 16.4 percent statewide average. Within the three-county region, Gilroy has the highest percentage of individuals below poverty level.

Table 1 Resource Study Area Ethnic Composition in 2014

Geographic Area	2014 Population	Percentage of Population (%)							
		Hispanic or Latino	Not Hispanic or Latino						
			White	African American	Native American	Asian	Native Hawaiian/Pacific Islander	Other Race	Two or More Races

[a] For this geography, the low-income level is set at the federal poverty level.
[b] For this geography, to account for the high cost of living, the low-income level is set at 200% of the federal poverty level.

2 ENVIRONMENTAL JUSTICE ADVOCACY AND COMMUNITY GROUPS

The following lists inform the outreach efforts to low-income and minority persons.

- Environmental justice and transportation advocacy groups that are active regionally or on a statewide scale (Table 3).
- Stakeholders and community organizations that provide services to or represent low-income and minority persons in the RSA (Attachment 1).

These organizations and groups advocate on behalf of low-income and minority populations in the RSA and are potential audiences for targeted outreach efforts. Table 3 lists organizations specifically dedicated to environmental justice and transportation, whereas Attachment 1 presents a more inclusive list of low-income and minority populations and organizations that serve those populations. As outreach continues, additional groups may be identified and added to either outreach list. An environmental justice database will be developed and updated periodically to track organizational contacts and outreach efforts.

Many of the environmental justice organizations shown in Table 3 advance environmental justice causes and advocate for minority or low-income populations in the RSA in addition to serving a broader geography. As such, several organizations are headquartered outside of the RSA.

Table 3 Environmental Justice and Transportation Advocacy and Community Groups Active in the Resource Study Area

Organization Name	Description	Website
California Endowment	State-wide grant-making organization that promotes fundamental improvements in the health status of all Californians	http://www.calendow.org/
California Environmental Justice Alliance	Statewide, community-led alliance that works to achieve environmental justice by advancing policy solutions	http://caleja.org/about-us/vision-and-history/
California Pan-Ethnic Health Network	State-wide network that promotes health equity by advocating for public policies and sufficient resources to address the health needs of communities of color	http://cpehn.org/
California Rural Legal Assistance	State-wide environmental justice and legal aid program that provides low-income rural Californians with free legal assistance	http://www.crla.org/
California Wellness Foundation	State-wide grant-making organization that addresses the particular health needs of traditionally underserved populations, including low-income individuals, people of color, youth and residents of rural areas	http://www.calwellness.org/
Center on Race, Poverty, and the Environment	San Joaquin Valley-focused environmental justice organization that seeks to achieve environmental justice and healthy, sustainable communities through collective action and the law	http://www.crpe-ej.org
Central California Environmental Justice Network	San Joaquin Valley-focused environmental justice network focusing on uniting activists and working with community members and stakeholders at local, regional, state and federal levels to eliminate environmental degradation in Valley Communities	http://ccejn.wordpress.com/

Organization Name	Description	Website
Central Coast Alliance United for a Sustainable Economy	Community organizing and advocacy organization that seeks to build grassroots power to invoke social, economic and environmental justice for the people of California's Central Coast Region	https://causenow.org
Central Valley Air Quality Coalition	San Joaquin Valley-focused coalition that works to ensure that all communities, of all races, cultures, class or creed, have the opportunity to be involved in the policy development and regulatory processes improving regional health	http://www.calcleanair.org/
Greenbelt Alliance	Bay Area-focused organization that seeks to protect natural and agricultural lands and shape the rules that govern growth around the San Francisco Bay Area	http://www.greenbelt.org/
Leadership Counsel for Justice and Accountability	San Joaquin Valley-focused, community-organizing advocacy group that seeks to affect land use and transportation planning, public investment priorities, environmental policy, and the provision of basic infrastructure and services	http://www.leadershipcounsel.org/

Rural Community Assistance Corporation	State-wide organization that provides training, technical/financial resources and advocacy for rural communities	http://www.rcac.org/home
The City Project	National organization that works to ensure that all people have access to healthy, livable communities	http://www.cityprojectca.org/
TransForm	Transportation organization that seeks to transform communities and transportation with new solutions, smarter investments, and better planning as well as improve community access, health, justice, and sustainability	http://www.transformca.org/
United Farmworkers	A national farmworker’s union and social justice organization that seeks to provide farm workers and other working people with the inspiration and tools to share in society's bounty	http://www.ufw.org/
Valley Improvement Projects	San Joaquin Valley-focused organization that seeks to improve the quality of life for underrepresented and marginalized residents of California’s Central Valley by promoting social and environmental justice issues through youth outreach, education, technology, and art	https://valleyimprovementprojects.org/
Voices from the Valley	San Joaquin Valley-focused organization that offers a centralized media outlet for Central Valley activist organizations	http://www.voicesfromthevalley.org/

3 ENVIRONMENTAL JUSTICE OUTREACH

In locations where low-income and minority populations could be affected by construction or operations of the project extent, outreach activities will be conducted to solicit community views on the project's potential impacts. The purposes of these outreach activities are to inform local community members of the project and its status; solicit input on thoughts and concerns; and gain an understanding of potentially adverse project effects on low-income and minority communities.

The Authority used demographic and income information to identify minority and/or low-income populations in the RSA. As discussed in Section 1.3, Project Section Demographics, the RSA includes substantial low-income and minority, particularly Hispanic, populations. According to the National Center for Health Statistics (2015), low-income and specific minority populations such as Hispanics are more likely to be dependent on smartphones than on landlines. Similarly, according to the Pew Research Center (2015), low-income and Hispanic populations are more likely to rely on smartphones over computers for internet connectivity.

In order to engage low-income and minority groups in the RSA in the development of the environmental analysis, higher-resolution demographic data have been analyzed to identify key low-income and minority populations and interview environmental justice advocacy and community groups to inform the outreach techniques used to engage these populations. Outreach activities are documented as they occur for inclusion in the Draft EIR/EIS Environmental Justice chapter.

Continued outreach[3] will be needed in low-income and minority populations to provide information about the HSR decisions currently under consideration (Section 1.1, Overview), as well as to address any potential impacts on low-income and minority populations. The low-income and minority populations will also be provided with updates on the entire statewide system, including key milestones and progress. This environmental justice outreach will serve to open lines of communication to gather environmental justice population input and insights on project actions, potential ramifications, and potential mitigation strategies. This information will then be used to inform key decision-making.

3.1 Outreach Strategy

The Authority is committed to implementing a comprehensive outreach program that reaches a broad array of interests throughout the RSA. The Authority will follow the Department of Justice LEP guidance to confirm that information about the project is accessible to LEP persons in the RSA.

The outreach strategy outlined below will be used to engage key environmental justice stakeholders during the project development and environmental review processes. All outreach efforts will be conducted in coordination with the Authority's Northern California Regional Director and the Authority's Offices of Communication and Legislation.

Following are the key strategic objectives of this environmental justice outreach plan:

- Identify and actively engage environmental justice advocacy and community groups and elected officials representing low-income and minority populations throughout the RSA. Provide structured and unstructured opportunities for these groups and officials to provide input.
- Provide clear, concise, and accurate information, in appropriate languages, regarding this Project Section and the development of the environmental impact report (EIR)/environmental impact statement (EIS).
- Identify and address any potential environmental impacts disproportionately borne by low-income and minority populations throughout the RSA.

[3] From 2008 to 2010, the Authority conducted an extensive series of stakeholder meetings in the study area to discuss the project's scoping phase. The stakeholder meetings included minority and low-income populations, and several stakeholder workshops offered translation services and presentations in Spanish.

- Develop and implement multiple avenues of communication for environmental justice stakeholders to receive project information and submit questions and comments (e.g., public meetings, group presentations, activity centers, project website, bilingual hotline).
- Facilitate constructive dialogue between key environmental justice stakeholders and the Authority. Communicate back to low-income and minority populations how feedback has been reflected in the process.
- Communicate the vision, purpose, and benefits of the California HSR system.
- Accurately document and respond to all public input received and meet all CEQA and National Environmental Policy Act (NEPA) requirements.

To achieve the above strategic objectives, the Authority will adhere to the following outreach best practices:

- Proactivity: outreach to low-income and minority populations should happen “early and often” to identify and address environmental justice concerns as far in advance of potential effects as possible.
- Inclusivity: offer early and continuous opportunities for input on project advancements to as broad a spectrum of impacted or interested stakeholders as is feasible.
- Sensitivity: be informed and aware of low-income and minority population sensitivities and historical experiences and relationships; consider these sensitivities in information sharing approaches and techniques.
- Consistency: ensure all presentations, written/visual messaging, and informal conversations are presenting the same information.
- Accessibility: ensure meeting times and locations are accessible to target audiences, prioritizing locations where low-income and minority populations frequent and feel most comfortable and times when they are available, and tailor outreach materials and distribution methods to maximize target audience reach by offering translation services that meet or exceed LEP standards.
- Follow-Through: follow up with stakeholder comments and concerns to the best extent feasible.

3.2 Outreach Activities

Table 4 outlines potential outreach activities the Authority could conduct to engage low-income and minority populations in this project extent. Activities will be vetted before implementation by both Authority staff and environmental justice advocacy and community groups to confirm that they will reach the intended audiences.

Table 4 Public Participation and Outreach Examples

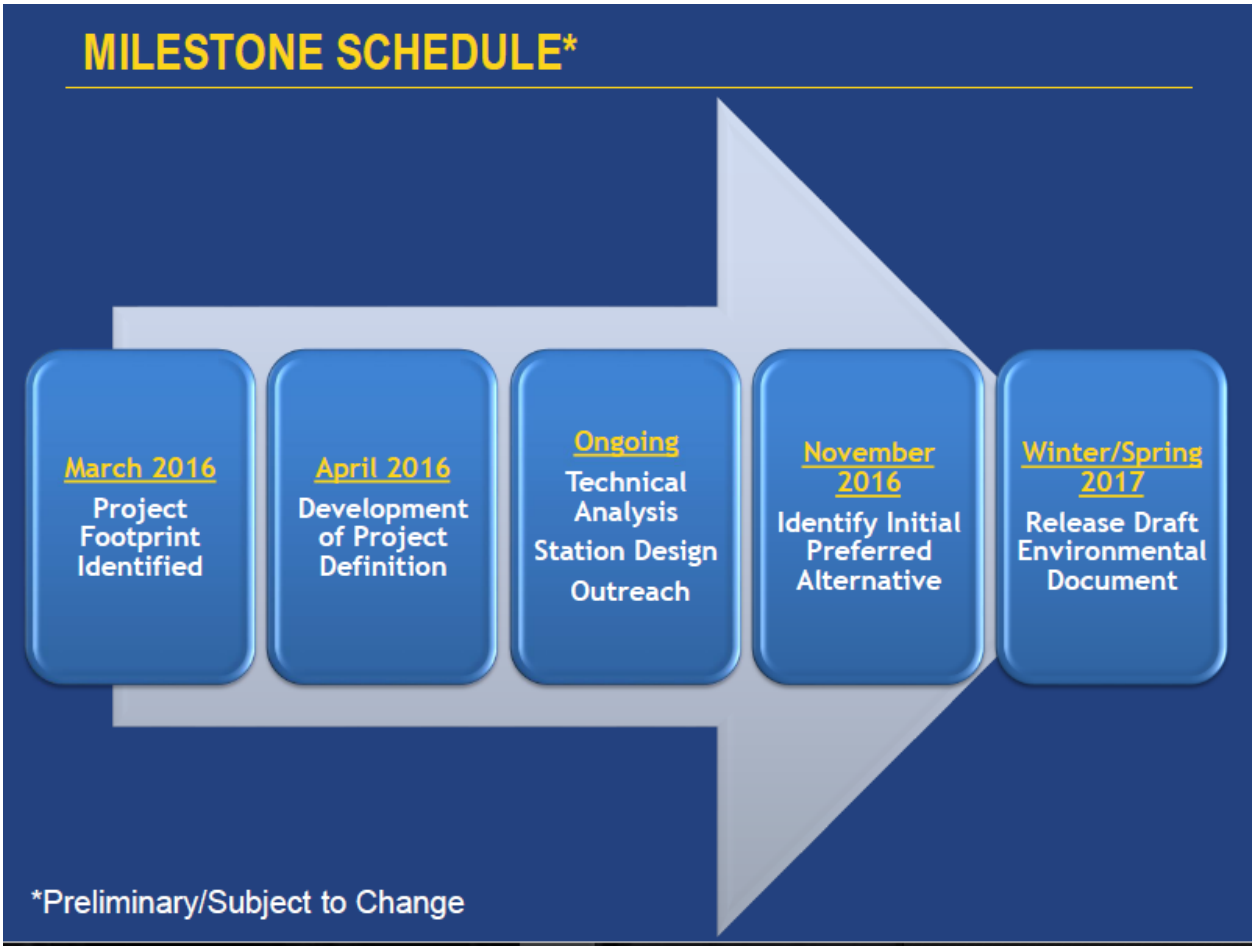
Example Outreach Category	Target Audience	Example Outreach Activity	Intended Outcome
Public meetings	All HSR stakeholders	Host periodic public meetings on the EIR/EIS HSR process in the RSA and solicit public comment	Disseminate key Authority EIR/EIS updates and receive suggestions and feedback via conventional public meetings
Organizational stakeholder contact	Environmental/social justice organizations	Connect with environmental justice advocacy and community groups to gauge their interest in scheduling meetings to offer project suggestions and inform stakeholder outreach processes	Establish a direct line of communication and a credible reputation with influential environmental justice advocacy and community groups who work in the RSA; gather valuable local insights on environmental justice challenges
Local stakeholder contact	RSA stakeholders, especially low-income and minority populations	Provide HSR tables and booths at local fairs and community events	Directly engage members of low-income and minority populations in HSR conversations to share relevant information, answer questions, and listen to perspectives; establish a two-way line of HSR communication in affected communities
Group stakeholder meetings	Multiple stakeholder agencies/ organizations	Organize meetings with multiple RSA advocacy and community groups and host collaborative, round-table discussions on HSR planning and key decisions	Gather and record topical HSR information as it pertains to low-income and minority populations to inform HSR processes
Digital engagement	RSA stakeholders, especially low-income and minority populations	Provide opportunities to participate, learn and provide input via online and mobile options	Directly engage members of low-income and minority populations in HSR without requiring in-person participation or home/office Internet access

HSR = high=speed rail
EIR/EIS = environmental impact report/environmental impact statement
RSA = resource study area

3.3 Outreach Implementation

The following sections present a general implementation approach for the environmental justice outreach strategy. Section 3.3.1, Public Meetings, reviews San Jose to Merced-specific events, or other relevant events organized and hosted by the Authority in which low-income and minority populations or organizations are invited to participate, receive updates, and/or offer feedback. Section 3.3.2, Environmental Justice Group Events and Meetings, reviews an approach to scheduling outreach events at which an HSR outreach representative would share relevant information with target low-income and minority population groups and gather insights from event attendees through any number of activities, such as tabling at public events or presenting to local organizations. Information gathered during these events will inform the HSR decision-making process.

Project milestones, illustrated on Figure 2, include project definition, scoping, technical analysis, identification of preferred alternative, and release of draft environmental document. Outreach efforts will be coordinated to meet these project milestones. Importantly, an environmental justice outreach implementation plan will be developed in concert with this document that will detail outreach specifics including targeted environmental justice populations, calendared events, outreach objectives, and strategies by environmental justice population and event, and outreach tracking and metrics. The implementation plan will be informed by higher-resolution demographics data as well as insights from environmental justice advocacy and community groups.



Source: Authority 2016

Figure 2 Draft Milestone Schedule for San Jose to Merced Project Section

3.3.1 Public Meetings

The Authority and its outreach team will schedule, coordinate, and facilitate public meetings, open houses and environmental review milestone meetings. These meetings will specifically include environmental justice advocacy and community groups to discuss any potential environmental impacts to low-income and minority populations in the RSA.

Meeting notifications may be distributed to the established list of environmental justice advocacy and community groups via email distribution and social media outlets. Advertisements may be placed in local non-English newspapers as determined by local demographics, and mail invitations may be distributed.

The Authority and its outreach team will secure all venues and coordinate logistics for each public meeting. Project fact sheets, welcome sheets, comment sheets and graphic displays will be developed and made available at every meeting.

All public meetings will be advertised and hosted per the requirements and best practices set forth by the Authority, including Title VI and LEP requirements (Authority 2016). These practices include offering translation services at public participation events. The Authority will provide translations of key documents such as comment cards and the draft EIS/EIR for LEP individuals who represent a significant population percentage of the geography in which the Authority is providing an activity or service. LEP regulation requires translation services to be offered when 5 percent of the county or state population being served is an LEP language population. The Authority will evaluate LEP needs at a finer population scale for local

and regional events to adhere to or exceed LEP guidelines as is sufficient to meet local language needs. Specific HSR summary documents and fact sheets for the project extent have been translated into Spanish, Vietnamese, and Chinese. To the extent that these documents are current with project advancements, they will continue to be made available to and advertised to low-income and minority populations. The Authority will develop and translate additional materials as deemed important to outreach efforts.

At the conclusion of each public meeting, meeting notes summarizing public comments and feedback will be prepared for use in further refining project details. The Authority will also develop and maintain a calendar of public outreach meetings and document meeting happenings by producing public meeting summaries that concisely capture key take-away messages from both the Authority and the environmental justice stakeholders in attendance

3.3.2 Environmental Justice Group Events and Meetings

In addition to coordinating Authority-hosted public meetings, the Authority will identify on-the-ground outreach opportunities through which they will increase their communication and engagement with low-income and minority populations in the RSA. These outreach opportunities will be coordinated with project milestones to share and gather timely and relevant information. The Authority will develop and maintain a calendar of potential environmental justice events and update the calendar periodically with upcoming events. The Authority will send advance notification of outreach events to environmental justice advocacy and community groups to allow environmental justice stakeholders to schedule accordingly. An HSR outreach representative will attend each of the approved identified events to share with and receive relevant information from the target environmental justice audience using the most relevant outreach strategy for the identified event (e.g., tabling at public events, presenting to local organizations, speaking on a webinar). The Authority will provide information about the process in a format that environmental justice organizations and elected officials representing low-income and minority populations can easily distribute to their constituents, such as in-language constituent newsletters and community news items.

In addition to public outreach, the Authority will coordinate with cultural resources specialists to ensure that historical resources that might be associated with well-established ethnic or other groups are identified. Such properties have the potential to be eligible for the National Register of Historic Places as traditional cultural properties. These properties can be defined generally as those that are eligible for inclusion in the National Register of Historic Places because they are associated with cultural practices or beliefs of a living community that are rooted in that community's history, and are important in maintaining the continuing cultural identity of the community. "Traditional" in this context refers to those beliefs, customs, and practices of a living community of people that have been passed down through the generations, usually orally or through practice. The traditional cultural significance of a historic property, then, is significance derived from the role the property plays in a community's historically rooted beliefs, customs, and practices. The following examples of properties are those that possess such significance:

- A location associated with the traditional beliefs of a Native American group about its origins, its cultural history, or the nature of the world.
- A rural community whose organization, buildings and structures, or patterns of land use reflect the cultural traditions valued by its long-term residents.
- An urban neighborhood that is the traditional home of a particular cultural group, and that reflects its beliefs and practices.
- A location where Native American religious practitioners have historically gone, and are known or thought to go today, to perform ceremonial activities in accordance with traditional cultural rules of practice.
- A location where a community has traditionally carried out economic, artistic, or other cultural practices important in maintaining its historic identity.

3.3.3 Digital Engagement

The Authority will develop ways for environmental justice stakeholders to learn about the project and provide input via smartphones and other mobile devices. For example, using mobile polling at community

events and public meetings or providing project information accessible via smartphones. The Authority will identify digital engagement opportunities that allow busy people to engage outside of work hours, do not require travel, and require an hour or less of participation. The Authority will use social media and digital outreach to provide information about broader engagement opportunities. All potential digital engagement approaches will be vetted by environmental justice advocacy and community groups to confirm each approaches potential for effective engagement and to leverage increased participation.

3.3.4 Environmental Justice Organizations and Community Working Group Engagement

The Authority will conduct quarterly community working group meetings in San Jose, Morgan Hill, Gilroy, and Los Banos over the course of the environmental review as a key venue for collaborative problem-solving and as a way to inform and shape the environmental review. Community working groups provide feedback from local communities and elected officials, insight on a wide variety of key considerations related to the environmental review, best methods to reach and engage constituency groups, and perceptions and feedback received from broader constituencies. The Authority will identify two to three environmental justice organizations to participate in each community working group. In addition, the Authority will conduct periodic check-ins with environmental justice groups to seek advice and input on the outreach effort. These environmental justice groups will be selected based on each groups' history of engagement with affected environmental justice populations and interest and willingness to communicate with the Authority. If there is greater interest on the part of the environmental justice organizations than there is capacity to communicate with each consistently, the Authority will narrow selected environmental justice partners based on maximum outreach potential.

3.3.5 Deliverables

The implementation of the outreach strategy and outreach activities detailed previously will lead to the following deliverables that will inform, among other items, project refinements, environmental mitigation plans, and future outreach activities:

- **Environmental justice database**: a database tool that records organizational contacts and tracks outreach efforts over time, including participation of environmental justice organizations, elected officials and stakeholders in community working group meetings, open houses, environmental milestone meetings and other venues and forums.
- **Environmental justice outreach implementation plan**: a detailed plan for environmental justice outreach implementation that specifies outreach strategies and techniques for each targeted environmental justice population, outreach objectives and tracking metrics, level of effort by project milestone, and outreach documentation.
- **External outreach meeting schedule**: a calendar of external outreach meetings or events at which an Authority representative will be present; this schedule will be reviewed and approved by Authority staff prior to implementation.
- **Internal outreach meeting schedule**: a calendar of outreach meetings or events hosted by the Authority.
- **Meeting agendas and notes**: draft agendas, internal and public meeting summaries, and feedback documentation for all environmental justice outreach-related internal and external meetings.
- **Meeting materials**: invitations, notices, signage, handouts, displays, staffing guides, and other relevant meeting/event materials; translated meeting materials will be provided for LEP populations in accordance with LEP regulation.
- **Digital content:** draft language for key environmental justice outreach and engagement efforts (e.g., social media pushes, mobile polls, website updates)

Attachment 1: Advocacy and Community Groups Serving Low-income and minority Populations

The following list of organizations serve minority and/or low-income communities in the resource study area. This list will be periodically updated to reflect organizational changes or additions.

Organization Name	Description	Geography	Point of Contact	Address	Email	Phone
Acacia Mobile Home Park	Mobile home park	Morgan Hill		18055 Monterey Rd, Morgan Hill, CA 95037		(408) 778-0177
Adams Broadwell Joseph & Cardozo (Attorneys)	Law Firm working on behalf of the labor movement to give a voice to workers and their families in their struggle to secure safe and sustainable jobs and communities	Sacramento	Daniel L. Cardozo	520 Capitol Mall # 350, Sacramento, CA 95814	dcardozo@adamsbroadwell.com	(916) 444-6201
Almaden Seniors Association	501 (C)(3) non-profit corporation that supports the City of San Jose Senior Program	San Jose, CA	Dominique Pacolba	6445 Camden Ave	dominique.pacolba@sanjoseca.gov	(408) 268-1133
Breathe California	Lung health organization that works in the Bay Area to fight lung disease in all its forms and works with its communities to promote lung health	Bay Area, San Benito County, Merced County	Ramya Chitatoor	1469 Park Ave. San Jose, CA 95126	ramya@lungsrus.org	(408) 998-5865
San Jose District 6 Leadership Group	Self-directed group of independent nonpartisan neighborhood association, neighborhood business, school and community leaders group organized to improve communication, research issues, that make recommendations and hold educational meetings to improve the District 6 community and San Jose	San Jose, CA				
Gavilan College	Local community college and administrator of the Gavilan Joint Community College District with campuses in Gilroy and Coyote Creek	Gilroy, CA	Jan Bernstein Chargrin	5055 Santa Teresa Boulevard Gilroy, CA 95020	jbchargin@gavilan.edu	(408) 848-4724

Organization Name	Description	Geography	Point of Contact	Address	Email	Phone
Gilroy Economic Development Corporation	501 (C) (3) non-profit corporation that offers a business assistance model for site selection services, rich data, workforce support and training, and assistance on permitting and development processes	Gilroy, CA	Tammy Brownlow	7471 Monterey Street, Gilroy, CA 95020	president@gilroyedc.org	(408) 847-7611
Gilroy Growing Smarter	Coalition of Gilroy residents who promote good stewardship of Gilroy and its land resources	Gilroy, CA	Connie Rogers	7690 Santa Theresa Drive, Gilroy, CA 95020		
Grassland Environmental Educational Center	Center that depicts the many significant contributions that wildlife managers, the agricultural community, sportsmen and environmentalists make in conserving San Joaquin Valley wetland and farmland resources	Los Banos, CA	Candace Sigmond	18110 Henry Miller Ave, Los Banos, CA 93635		(209) 704-4772
Lenders of Community Development (LCD) of San Jose	Development organization that assists families in becoming homeowners, offers small business loans to low-income individuals, finances the construction of affordable housing, and provides loans for community facilities	San Jose, CA		111 W. St. John Street, Suite 800, San Jose, CA	info@opportunityfund.org	(408) 297-0204
Madera County Economic Development Commission	Commission that assists with business recruitment, expansion and retention with a particular focus on new job creation	Madera County, CA	Bobby Kahn	2425 West Cleveland Avenue, Suite 101, Madera, CA	bkahn@maderacountyedc.com	(559) 675-7768
Oak Grove School District	School district serving southern Santa Clara County	Southern Santa Clara County, CA	Laura Phan	6578 Santa Teresa Blvd. San Jose, CA 95119-1204	business_support_services@ogsd.net	(408) 227-8300, ext. 100216
San Jose Downtown Residents Association	Residents association representing a diverse socio-economic group of residents in the downtown San Jose core that promotes partnerships with the city government and neighborhood businesses	San Jose, CA	Steve Barkley	PO Box 90264, San Jose, CA 95113-9998	info@sjpeople.org	

Organization Name	Description	Geography	Point of Contact	Address	Email	Phone
San Jose Strong Neighborhoods Initiative	Partnership between the City of San Jose, the Redevelopment Agency and San Jose's residents and business owners to strengthen the city's neighborhoods by building clean, safe and strong neighborhoods with independent, capable, and sustainable neighborhood organizations	San Jose, CA	Steve McHarris	200 E. Santa Clara Street, 3rd Floor, San Jose, CA 95113	customerservice@sanjoseca.gov	(408) 535-3555
San Jose Unified School District - River Glen	School district serving the City of San Jose	San Jose, CA	Nancy Albarran	855 Lenzen Avenue, San Jose, CA 95126	nalbarran@sjusd.org	(408) 535-6000
San Jose Word of Faith Christian Center	Faith organization working to foster economic vitality in San Jose	San Jose, CA		873 Delmas Ave, San Jose, CA 95125	General1@sjwofcc.org	(408) 295-0877
Santa Teresa Citizen Action Group	Citizen group that educates residents about neighborhood issues					
Silicon Valley Land Conservancy	Conservancy that maintains and promotes the downtown San Jose core as a livable, family-oriented community with a high quality of life	San Jose, CA	Craig Edgerton	117 Bernal Rd, # 70-181 San Jose, CA 95119	cedgerton@siliconvalleylc.org	(408) 460-1102
Silicon Valley Leadership Group	Leadership group that provides an open and transparent view of where local candidates for office in Silicon Valley stand on key issues that impact our local economy and quality of life	San Jose, CA	Chris O'Connor	2001 Gateway Place, Suite 101E, San Jose, CA 95110	coconnor@svlg.org	(408) 501-7884
South Bay Labor Council	Labor Council representing 97 unions and over 100,000 union members in Santa Clara and San Benito counties	South Bay	David Urhausen	2102 Almaden Road, Suite 114 San Jose, California 95125	David@southbaylabor.org	(408) 606-2060
Southside Community Center	Community center that offers classes to local residents	San Jose, CA		5585 Cottle Rd. San Jose, CA, 95123		(408) 629-3336

Organization Name	Description	Geography	Point of Contact	Address	Email	Phone
Templo La Hermosa	Church in San Jose	San Jose, CA		59 South Montgomery St. San Jose, CA 94103, United States	info@tlahermosa.org	(408) 293-4406
Train Riders Association of California	Association that helps in community engagement for transportation planning and advocacy for Bay Area transit			1025 9th St, Sacramento, CA 95814		(916) 557-1667
Transportation Solutions Defense and Education Fund	Blog that covers transportation news specifically related to CA HSR; offers a repository of ideas for how to achieve a better future by shifting transportation funding	Bay Area		P.O. Box 151439 San Rafael, CA 94915	info@transdef.org	(415) 331-1982
United Neighborhoods of Santa Clara County	A coalition of neighborhood associations and homeowners associations in Santa Clara County	Santa Clara County	Ken Podgorsek	P.O. Box 90430 San Jose, CA 95109	execdir@unscc.org	
United Way Silicon Valley	Organization focused on community resources for families and individuals in San Jose, specifically for education and raising children	San Jose, CA	Sandra Miley	1400 Parkmoor Ave, Suite 250 San Jose, CA 95126	Sandra.Miley@uwsv.org	(408) 345-4302
USDA Natural Resource Conservation Service	Service supporting farmers and ranchers with financial assistance to improve the environment and agricultural operations	National; offices in Half Moon Bay/Santa Rosa/Salinas	Carlos Suarez	430 G Street #4164 Davis, CA 95616-4164	Carlos.Suarez@ca.usda.gov	(530) 792-5600
Vistapark, Encore and Echo Valley, Parkview Valley Community Association	Community association enabling participation in neighborhood activities	San Jose, CA (Vista Park)		Meetings in Vista Park		
Village of the Four Seasons Mobile Home Community	Mobile home community			200 Ford Road San Jose, CA 95138		(408) 225-7255

Wilderness Society	Conservation organization protecting wildlands and associated benefits (e.g. air and water quality)	San Francisco, CA	Adam Bad Wound	250 Montgomery St Suite 210, San Francisco, CA 94104	Badwound@tws.org	(415) 398-1111 x104
Winchester Neighborhood Action Committee	Social network for the Winchester area to RSVP to neighborhood meetings and learn about meeting agendas	San Jose, CA (Winchester)				

APPENDIX 5-B: ENVIRONMENTAL JUSTICE ENGAGEMENT SUMMARY REPORT

California High-Speed Rail Authority

San Jose to Merced Project Section

Environmental Justice Engagement Summary Report

February 2022

CALIFORNIA High-Speed Rail Authority

The environmental review, consultation, and other actions required by applicable federal environmental laws for this project are being or have been carried out by the State of California pursuant to 23 U.S.C. 327 and a Memorandum of Understanding dated July 23, 2019, and executed by the Federal Railroad Administration and the State of California.

TABLE OF CONTENTS

1 INTRODUCTION 1-1

2 FEDERAL AND STATE LAWS, REGULATIONS, AND ORDERS 2-1
2.1 Federal 2-1
2.1.1 Title VI of the Civil Rights Act of 1964 2-1
2.1.2 U.S. Presidential Executive Order 12898 and Accompanying Presidential Memorandum 2-1
2.1.3 U.S. Department of Transportation Order 5610.2C 2-1
2.1.4 Federal Transit Administration Circular 4703.1 2-1
2.1.5 U.S. Presidential Executive Order 13166 2-2
2.1.6 Americans with Disabilities Act (42 U.S.C. §§ 12101–12213) 2-2
2.1.7 Uniform Relocation Assistance and Real Property Acquisition Act (42 U.S.C. § 61) 2-2
2.2 State 2-2
2.2.1 California Government Code 65040.12(e) 2-2
2.2.2 California Relocation Assistance Act (Gov. Code, § 7260 et seq.) 2-3
2.2.3 California Government Code Section 11135(a), 11136 2-3
2.2.4 California Global Warming Solutions Act of 2006 (SB 535) (De León) 2-3
2.3 Authority Commitment 2-3

1 INTRODUCTION

Since publication of the Draft Environmental Impact Report (EIR)/Environmental Impact Statement (EIS), the following substantive changes have been made to this appendix:

- References to older versions of U.S. Department of Transportation (USDOT) Order 5610.2C, issued May 14, 2021, were updated to Order 5610.2C in this appendix.
- Demographic data was updated in Table 1, based on confirmation with the original data sources. Text discussing the content of Table 1 was updated.
- Section 4.2.2.4, Interviews Related to Environmental Justice, was updated to include interviews conducted between November 2019 and April 2020, including new Table 5 and updated Figure 1.
- Section 4.2.2.5, Environmental Justice–Focused Meetings and Other Events, was updated to include outreach events between January and April 2020.
- Section 4.2.2.6, Group Stakeholder and Community Working Group Meetings, was updated.
- Section 4.3, Outreach Efforts After the Release of the Draft EIR/EIS, and Section 4.4.2, After Publication of the Draft EIR/EIS, were added.
- Chapter 5, Ongoing Environmental Justice Engagement Activities, was updated to state the California High-Speed Rail Authority's (Authority) commitment to ongoing engagement with communities and individuals that would be affected by the project after release of the Final EIR/EIS and adoption of the Record of Decision.
- Attachment D, Environmental Justice Outreach, September 2021, was added.

Environmental justice is the fair treatment of people of all races, cultures, and income with respect to the development, adoption, implementation, and enforcement of environmental laws and policies. The roots of environmental justice are in Title VI of the Civil Rights Act of 1964, which prohibits discrimination based on race, color, and national origin, including the denial of meaningful access for persons with limited English proficiency, in programs and activities receiving federal financial assistance. The Authority is committed to incorporating environmental justice considerations into its program, policies, and activities, and complies with federal, state, and other laws and regulations relevant to environmental justice.

U.S. Presidential Executive Order (USEO) 12898 (1994), Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, requires federal agencies to "ensure the full and fair participation by all potentially affected communities in the decision-making process; to avoid/mitigate disproportionately high and adverse human health and environmental effects, including interrelated social and economic effects of their programs, policies and activities on low-income and minority populations; and to prevent the denial of, reduction in, or significant delay in the receipt of benefits to low-income and minority populations." A key component of compliance with USEO 12898 is outreach to potentially affected minority populations and low-income populations. Minority populations and low-income populations are defined by USDOT Order 5610.2C (May 2021) as follows:

- A *minority population* means any readily identifiable group or groups of minority persons who live in geographic proximity and, if circumstances warrant, geographically dispersed or transient persons (such as migrant workers, students, or Native Americans). Minority includes persons who are Black, Hispanic or Latino, Asian American, American Indian and Alaska Native, and Native Hawaiian and other Pacific Islander.
- *Low-income* means a person whose median household income is at or below the U.S. Department of Health and Human Services poverty guidelines. A locally developed threshold or a percentage of median income for the area may also be used, provided that the threshold is at least as inclusive as the poverty guidelines. A *low-income population* means any readily identifiable group of low-income persons who live in geographic proximity and, if

circumstances warrant, geographically transient persons (such as migrant workers, students, or Native Americans).

Additionally, USEO 13166, Improving Access to Services for Persons with Limited English Proficiency (LEP), issued in 2000, requires that federal agencies take reasonable steps to make sure that LEP persons have meaningful access to information about the agency's programs and activities (including projects) and states that "each Federal agency shall prepare a plan to improve access to its federally conducted programs and activities by eligible LEP persons."

This *San Jose to Merced Project Section Environmental Justice Engagement Summary Report* provides an overview of the identification of minority populations and low-income populations in the vicinity of the San Jose to Merced Project Section (Project Section) of the California High-Speed Rail (HSR) System. The report focuses on the portion of the Project Section between San Jose and Carlucci Road (San Jose to Central Valley Wye Project Extent, or simply project). It documents and summarizes engagement activities undertaken to involve members of minority populations and low-income populations in communities along the project alignment during the planning and design of the HSR project. It focuses on outreach and communication with these populations and documents successful efforts to engage individuals and community groups in an open dialog about project benefits and impacts, and to work cooperatively in refining the design of the project alternatives. This report does not provide an exhaustive discussion of the substantial outreach and coordination during the development of the HSR program. Additional information on the outreach and engagement activities, particularly materials related to public outreach and scoping, can be accessed via the Authority's website, www.hsr.ca.gov.

2 FEDERAL AND STATE LAWS, REGULATIONS, AND ORDERS

This chapter provides an overview of the applicable federal and state laws, regulations, orders, and plans that are relevant to the analysis of environmental justice.

2.1 Federal

2.1.1 Title VI of the Civil Rights Act of 1964

Title VI of the Civil Rights Act (42 United States Code [U.S.C.] § 2000(d) et seq.) was enacted as part of the landmark Civil Rights Act of 1964. It prohibits discrimination based on race, color, and national origin in programs and activities receiving federal financial assistance.

2.1.2 U.S. Presidential Executive Order 12898 and Accompanying Presidential Memorandum

USEO 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, directs recipients and subrecipients of federal financial funding or other assistance to develop an agency-wide strategy to achieve environmental justice in its planning and project delivery. The Presidential Memorandum accompanying USEO 12898 emphasizes the importance of existing laws, such as Title VI of the Civil Rights Act of 1964 and the National Environmental Policy Act (NEPA) of 1969, that can assist with implementation of the principles of the order. The memorandum provides that, in accordance with Title VI, "each Federal agency shall ensure that all programs or activities receiving Federal assistance that affect human health or the environment do not directly, or through contractual or other arrangements, use criteria, methods, or practices that discriminate on the basis of race, color, or national origin." It calls for specific actions to be directed in NEPA-related activities. They include:

- Analyzing environmental effects, including human health, economic, and social effects on minority populations and low-income populations when such analysis is required by NEPA.
- Making sure that mitigation measures outlined or analyzed in environmental assessments, EISs, and Records of Decision, whenever feasible, address disproportionately high and adverse environmental effects or proposed actions on minority populations and low-income populations.
- Providing opportunities for community input in the NEPA process, including identifying potential effects and mitigation measures in consultation with affected communities and improving accessibility to public meetings, official documents, and notices to affected communities.

2.1.3 U.S. Department of Transportation Order 5610.2C

The USDOT issued Order 5610.2C, Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, on May 14, 2021. This order reaffirms the USDOT's commitment to environmental justice and clarifies aspects of the 1997 Environmental Justice Order. It describes how the objectives of environmental justice will be integrated into planning and programming, rulemaking, and policy formulation. The order sets forth steps to prevent disproportionately high and adverse effects on minority populations and low-income populations through environmental justice analyses conducted as part of federal transportation planning and NEPA provisions. It also describes the specific measures to be taken to address instances of disproportionately high and adverse effects and sets forth relevant definitions.

2.1.4 Federal Transit Administration Circular 4703.1

The Federal Transit Administration (FTA) Circular 4703.1, Environmental Justice Policy Guidance for Federal Transit Administration Recipients, provides guidance on incorporating environmental justice principles into transportation plans, projects, and activities that receive financial assistance from the FTA. It provides recommendations on how to fully engage minority populations and low-income populations in the public transportation planning and decision-making process; how to

determine whether minority populations and low-income populations would be subjected to disproportionately high and adverse effects; and how to avoid, minimize, or mitigate these effects.

2.1.5 U.S. Presidential Executive Order 13166

USEO 13166, Improving Access to Services for Persons with Limited English Proficiency (LEP), requires each federal agency to make sure that recipients of federal financial assistance are provided meaningful access to their programs and activities, including applicants and beneficiaries with limited English proficiency. It requires that agencies examine the services they provide, identify needs for services to those with limited English proficiency, and develop and implement systems to provide those services.

2.1.6 Americans with Disabilities Act (42 U.S.C. §§ 12101–12213)

The Americans with Disabilities Act (ADA) of 1990 prohibits discrimination against persons with disability and requires equal opportunity in employment, state and local government services, public accommodations, commercial facilities, and transportation.

2.1.7 Uniform Relocation Assistance and Real Property Acquisition Act (42 U.S.C. § 61)

The Uniform Relocation Assistance and Real Property Acquisition Act (Uniform Act) of 1970 stipulates that persons displaced from homes, businesses, and farms as a result of a federal action or by an undertaking involving federal funds must be treated fairly, consistently, and equitably. This protects people so that they will not suffer disproportionate injuries as a result of projects designed for the benefit of the public as a whole.

The objectives of the Uniform Act are to:

- Provide uniform, fair, and equitable treatment of persons whose real property is acquired or who are displaced in connection with federally funded projects.
- Make certain relocation assistance is provided to displaced persons to lessen the emotional and financial impact of displacement.
- Make certain that no individual or family is displaced unless decent, safe, and sanitary housing is available within the displaced person's financial means.
- Help improve the housing conditions of displaced persons living in substandard housing.
- Encourage and expedite acquisition by agreement and without coercion.

2.2 State

An environmental justice analysis is required by federal law but is not explicitly required by the State of California. The California Environmental Quality Act (CEQA) focuses on whether a project would have a significant impact on the physical environment and whether the environmental impacts of a project would cause substantial adverse impacts on human beings. Although specific provisions of CEQA require consideration of how the environmental and public health burdens of a project would affect certain communities (e.g., through consideration of the environmental setting and the assessment of cumulative impacts of a project), CEQA does not directly address environmental justice or the fair treatment of individuals and communities, and, as a result, CEQA determinations are not included in this report. Nevertheless, the well-established CEQA principles and provisions of California Government Code Section 11135 impose environmental justice obligations that local governments must consider when approving specific projects and planning for future development.

2.2.1 California Government Code 65040.12(e)

California Government Code (Gov. Code) Section 65040.12(e) defines *environmental justice* as “the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies.”

2.2.2 California Relocation Assistance Act (Gov. Code, § 7260 et seq.)

In parallel with the federal law, the California Relocation Assistance Act requires state and local governments to provide relocation assistance and benefits to displaced persons because of projects undertaken by state and local agencies that do not involve federal funds. However, because the HSR system receives federal funding, the Uniform Relocation Assistance and Real Property Acquisition Act takes precedence.

2.2.3 California Government Code Section 11135(a), 11136

California Government Code Section 11135(a) prohibits discrimination or the denial of full and equal access to benefits of any program or activity operated or funded by the state or a state agency based on race, national origin, ethnic group identification, religion, age, sexual orientation, color, or disability. This provision requires local agencies to consider fairness in the distribution of environmental benefits and burdens. It is enforced through Section 11136, which reduces or eliminates state funding of local government agencies determined to be in violation of Section 11135(a).

2.2.4 California Global Warming Solutions Act of 2006 (SB 535) (De León)

The California Global Warming Solutions Act of 2006: Greenhouse Gas Reduction Fund requires a CEQA analysis to identify disadvantaged communities for investment opportunities, as specified. The bill requires the California Department of Finance, when developing a specified 3-year investment plan, to allocate 25 percent of the available moneys in the Greenhouse Gas Reduction Fund to projects that provide benefits to disadvantaged communities, as specified, and to allocate a minimum of 10 percent of the available moneys in the Greenhouse Gas Reduction Fund to projects in disadvantaged communities. The bill requires the California Department of Finance, when developing funding guidelines, to include guidelines for how administering agencies should maximize benefits for disadvantaged communities. Senate Bill (SB) 535 also requires that the administering agencies report to the California Department of Finance, which in turn, provides a description of how these agencies have fulfilled specified requirements relating to projects providing benefits to, or located in, disadvantaged communities to the Legislature in a specified report.

2.3 Authority Commitment

The Authority has included environmental justice considerations in its planning for the California HSR System since 2000, when it commenced a programmatic environmental review. The Authority's Environmental Justice Guidance follows the best practices of the FTA Circular 4703.1 and is guided by a commitment to provide equal protection under the laws to all people.

In August 2012, the Chief Executive Officer of the Authority, Jeff Morales, signed the Policy Directive Number Poli-SB-02 related to environmental justice. The directive stated:

> *The California High-Speed Rail Authority (Authority) promotes Environmental Justice into its programs, policies, and activities to avoid, minimize or mitigate disproportionately high human health, environmental effects, including social and economic effects on minority [populations] and low-income populations. It is the policy of the Authority to duly emphasize the fair and meaningful involvement of all regardless of race, color, national origin or income with respect to the high-speed rail project planning, development, operations and maintenance. This policy directs the Authority to appropriately engage the public through public participation forums so that decisions are mitigated and reflects environmental justice for all communities. This commitment strives to inspire environmental justice and equal access.*

Consistent with this directive, in August 2012 the Authority also published guidance that listed relevant federal and state policies and guidelines on environmental justice and provided instructions on how these policies and guidance should be interpreted and implemented in HSR

environmental analysis documents. According to the guidance, there are three fundamental environmental justice principles:

- To avoid, minimize, or mitigate disproportionately high human health and environmental effects, including social and economic effects, on minority populations and low-income populations.
- To promote the full and fair participation by all affected communities in the transportation decision-making process.
- To prevent the denial of, reduction in, or significant delay in the receipt of benefits by minority populations and low-income populations.

Based on this guidance, for individual Project Sections, the identification and documentation of efforts to assess the impact of the HSR project on minority populations and low-income populations is to be included in the environmental justice chapter of each project-level EIR/EIS. The environmental justice chapter must document outreach events held to engage minority populations and low-income populations. The chapter must conclude with a determination of whether the project would result in disproportionately high and adverse effects on minority populations and low-income populations and provide for mitigation so that the project meets the Authority's commitments regarding environmental justice.

3 MINORITY POPULATIONS AND LOW-INCOME POPULATIONS

Environmental justice effects are evaluated by determining whether there is a potential for disproportionately high and adverse effects from the project on minority populations and low-income populations. In addition to minority populations and low-income populations, the environmental justice analysis also examines the distribution of sensitive populations, such as linguistically isolated, disabled, or elderly persons. This section defines the reference community and resource study area (RSA) for the analysis, summarizes the methods for identification of minority populations and low-income populations, and provides an overview of the minority populations and low-income populations within the reference community and RSA.

3.1 Definition of Reference Community and Resource Study Area

The reference community for the environmental justice analysis is the three-county region of Santa Clara, San Benito, and Merced Counties. This area represents the general population that could be affected adversely and beneficially by the project alternatives. Information for these three counties provides context and allows for comparison and contrast between communities within the RSA and the surrounding areas.

The RSA for direct and indirect effects on minority populations and low-income populations is defined as the census tracts partially or fully within the project alternatives' footprints and a 0.5-mile buffer zone from the project footprint for each of the project alternatives. Potentially affected communities within the RSA include portions of Santa Clara, San Jose, Morgan Hill, San Martin, Gilroy, Santa Nella, Volta, and Los Banos.

3.2 Methods for Identification of Minority Populations and Low-Income Populations

Census tract data on minority populations and low-income populations within the reference community and environmental justice RSA were collected from the U.S. Census Bureau 2010–2014 American Community Survey (ACS). The populations were mapped along the project alignment using geographic information systems, and census tracts with high percentages of minority individuals and low-income individuals were identified.

The definition of minority populations is consistent with the USDOT Order 5610.2C, as described in Chapter 1, Introduction. Minorities include persons who are Black, Hispanic or Latino, Asian American, American Indian and Alaska Native, and Native Hawaiian and other Pacific Islander. For the purposes of this analysis, low-income populations in San Benito and Merced Counties are defined as persons whose household income is at or below the U.S. Department of Health and Human Services poverty guidelines. For populations in Santa Clara County, a locally developed threshold is used to account for the substantially higher household incomes in the San Francisco Bay Area relative to other California counties. This analysis defines low-income populations within Santa Clara County to be persons with household incomes at or below 200 percent of the poverty guidelines.[1]

3.3 Minority Populations and Low-Income Populations within the Reference Community and RSA

Table 1 shows the percent minority populations and percent low-income populations in the three-county reference community and in the cities and communities within the environmental justice RSA. Chapter 5, Environmental Justice, of the *San Jose to Merced Project Section Final EIR/EIS* (Final EIR/EIS) provides a detailed discussion and mapping of the minority populations and low-income populations with the potential to be affected by the project.

[1] This is consistent with the approach adopted by the Metropolitan Transportation Commission.

Table 1 Minority Populations and Low-Income Populations (2014 Estimates)

Characteristics	Population	Percent Minority	Percent Low-Income
Counties			
Santa Clara County	1,841,569	62.8	23.3
San Benito County	56,888	60.8	12.1
Merced County	261,609	67.8	25.6
Reference Community Total	**2,160,066**	**63.4**	**23.3**
Cities and Communities within the Resource Study Area			
Santa Clara	119,525	62.2	22.2
San Jose	986,320	69.6	27.6
Morgan Hill	39,875	46.3	24.4
San Martin	7,081	55.3	21.3
Gilroy	50,776	67.0	35.5
Volta	257	61.9	9.7
Los Banos	36,626	75.5	24.5

Sources: U.S. Census Bureau ACS 2010–2014a, 2010–2014b

As Table 1 shows, 23.3 percent of the population within the reference community is low-income, and 66.3 percent is minority (U.S. Census Bureau ACS 2010–2014a, 2010–2014b). Santa Clara and Merced Counties have higher rates of low-income populations than San Benito County, while the concentrations of minority populations are very similar among the three counties. The racial and ethnical makeup of the reference community varies—Asians are the largest minority group in Santa Clara County (33 percent), while Hispanics and Latinos make up the largest minority group in San Benito and Merced Counties (57 and 56 percent, respectively).

The economic conditions in the cities and communities within the RSA vary, and the percent low-income population ranges from a low of 9.7 percent low-income in Volta to a high of 35.5 percent low-income in Gilroy (Table 1). Gilroy has the highest percent low-income population, which exceeds that of the reference community by 12 percent. The percent minority ranges from 46.3 percent in Morgan Hill to 75.5 percent in Los Banos. Based on available census information and the proximity of the project alternatives, the following areas within the RSA have been identified as having concentrations of minority populations and low-income populations, or both, that are greater than the reference community:

- Santa Clara
  - Industrial area bounded by Lawrence Expressway on the west, Norman Y. Mineta International Airport on the east, U.S. Highway (US) 101 to the north, and the existing Caltrain tracks to the south, and a residential area bound by Scott Boulevard and El Camino Real, which consists of 77 percent minority and 39 percent low-income residents.
  - Residential area south of the existing Caltrain tracks, bounded by El Camino Real to the north, Pierce Street and Winchester Boulevard to the west, Newhall Street to the south, and Park Avenue and Alviso Street to the east, which ranges from 40 to 50 percent low-income residents.
- San Jose
  - Residential neighborhoods bounded by Interstate (I-) 880 to the north, Curtner Avenue to the south, State Route (SR) 87 to the west, and 10th Street and Senter Road to the east

that include Hyde Park, Jackson/Taylor, Ryland, Hensley, Horace Mann, North Campus, South Campus, East Campus, Naglee Park, Paseo, Market/Almaden, East Virginia, Spartan/Keys, Lakehouse, Park/Lorraine, Auzerais/Josefa, Gardner, Washington/Guadalupe, Tamien, Goodyear/Mastic, Alma, Monticello, Guadalupe/Almaden, Almaden/Clara Filice, Evans, and Guadalupe Canoas neighborhoods. These neighborhoods generally consist of census tracts with concentrations of minority populations more than 75 percent, with the highest concentrations in the Tamien and Goodyear/Mastic neighborhoods (94 percent minority) and the Market/Almaden and Washington/Guadalupe neighborhoods (86 percent minority). These neighborhoods also have high concentrations of low-income populations, typically more than 35 percent. The greatest concentrations of low-income populations occur in the Tamien and Goodyear/Mastic neighborhoods (58 percent low-income), Market/Almaden, Washington/Guadalupe, Spartan/Keys, and East Virginia neighborhoods (56 percent low-income), and Guadalupe/Almaden, Almaden/Clara Filice, Evans, and Guadalupe Canoas neighborhoods (52 percent low-income).

  - Residential neighborhoods bounded by Curtner Avenue to the north, Blossom Hill or SR 85 to the south, Monterey Road or Snell Avenue on the west, and Senter Road or US 101 to the east. East of the Caltrain right-of-way are the neighborhoods of Kenwood, Hillsdale, Rancho, Los Arboles, Seven Trees, San Ramon, Riverview, Danna Rock, Davis, Edenvale, Sunspring, and Silver Leaf. West of the Caltrain right-of-way are the Woods, Berry Park, and Deer Run neighborhoods. The highest concentrations of minority populations occur in the neighborhoods of Los Arboles and Seven Trees (97 percent minority), while the greatest concentrations of low-income populations occur in Edenvale (58 percent low-income) and Seven Trees (52 percent low-income).

- Morgan Hill
  - Residential areas in downtown and southern Morgan Hill, located west of Monterey Road between Llagas Road and Tennant Avenue, and east of Monterey Road between Dunne Avenue to the north and Maple Avenue or Crowner Avenue to the south. These areas contain 36 to 45 percent low-income households and include a mobile home community along Monterey Road.
- Gilroy
  - Residential areas in downtown Gilroy, bounded by Buena Vista Avenue to the north, Mesa Road to the south, US 101 on the east, and Wren Avenue or Miller Avenue to the west. The highest concentrations of minority populations and low-income populations are between Las Animas Avenue, Monterey Road, and US 101 in downtown Gilroy, where between 61 and 69 percent of residents are low-income, and more than 85 percent are minority.
  - Rural agricultural areas east of Gilroy have low-income populations of approximately 40 percent.
- Merced County
  - Residential portions of northern Los Banos and rural agricultural areas north and east of Los Banos, bounded by Henry Miller Road to the north, SR 33 to the south, Badger Flat Road to the west, and Delta Road to the east. Minority population concentrations in these areas are more than 81 percent.

4 OUTREACH TO MINORITY POPULATIONS AND LOW-INCOME POPULATIONS

The Authority has conducted early and continued public and agency outreach throughout the environmental review and alternatives development processes. As part of these efforts, the Authority held the following types of meetings and outreach events, which provided opportunities for engagement with the public, including minority populations and low-income populations, sensitive populations, and regulatory agencies:

- Interagency technical working group meetings
- Community working group meetings
- Public information meetings
- Informal meetings with key community leaders, select members of the public, and local/resource agency staff
- Informal resource-specific agency meetings
- Informational open houses and informal presentations to community organizations and groups
- Letter, email, and phone requests for information and informal consultation
- Distribution of public notices, fact sheets, and a Frequently Asked Questions document with project information and updates on the ongoing studies

Chapter 9, Public and Agency Involvement, of the Final EIR/EIS provides a detailed account of the public engagement work undertaken by the Authority and the FRA to date. In total, over 800 such meetings and public and agency involvement activities were initiated by the Authority or attended by representatives of the HSR project within the vicinity of the San Jose to Merced Project Section between December 2008 and December 2018.

The Authority also conducted targeted outreach to minority populations and low-income populations (see Chapter 5 of the Final EIR/EIS for information on the geographic concentrations of these populations). The purpose of targeted outreach is to understand and address the unequal environmental burden often borne by minority populations and low-income populations. Understanding the location and makeup of minority populations and low-income populations near the project allowed the Authority to tailor outreach activities for effective public participation and access to information. In addition, the outreach provides these populations with early and ongoing opportunities to provide input on the HSR project and assist in identifying social, economic, and environmental effects as well as potential mitigation measures that could be used to avoid or minimize adverse effects.

The Authority has conducted this outreach to minority populations and low-income populations with the understanding that these efforts are most effective when done from the earliest opportunity and maintained over the course of the project. Outreach was also coordinated with trusted individuals and organizations, such as faith-based organizations, neighborhood associations, community centers, and schools. This approach provides a bridge between the community and the project and provides a forum to gain the input of leaders and members of communities with minority populations and low-income populations who are able to provide insights that may not otherwise be apparent. The resulting input is used to make sure the project would not result in disproportionately high and adverse effects on minority populations and low-income populations relative to the potential benefit gained by those populations from the project.

Outreach undertaken as part of the Project Section is relevant to the San Jose to Central Valley Wye Project Extent. The San Jose to Merced Project Section Draft EIR/EIS process began in 2008 and continued with public discussions through 2012 about the range of alternatives for evaluation. Various alignment and profile design options were considered in the *San Jose to Merced Section High-Speed Rail EIR/EIS, Preliminary Alternatives Analysis Report* (Preliminary

Alternatives Analysis Report) published in June 2010 and *San Jose to Merced Section High-Speed Rail EIR/EIS, Supplemental Alternatives Analysis Report* (Supplemental Alternatives Analysis Report) published in May 2011 (Authority and FRA 2010, 2011). Additional consultation with stakeholders and regulatory agencies through 2019 continued to inform the range of project alternatives being considered. During this time, a variety of outreach activities were conducted, the results of which can be reviewed in the public documents noted in this section.

4.1 Early Project Phase Public and Agency Outreach

4.1.1 Project Scoping and Notice of Preparation (December 2008 to March 2009)

The Authority initiated prescoping public outreach activities in December 2008, including the development of project information materials, establishment of a project information phone line, early engagement with interested parties, and media communications. On February 23, 2009, the Authority distributed a Notice of Preparation announcing preparation of an EIR for the Project Section. The Federal Railroad Administration (FRA) published a Notice of Intent in the *Federal Register* on March 16, 2009, announcing the preparation of an EIS for the Project Section.

The Authority and the FRA initiated scoping in March 2009, and the Authority held scoping meetings in Merced, San Jose, and Gilroy. More than 300 residents, property and business owners, agency representatives, elected officials, members of the media, and other interested parties participated in these meetings. The Authority provided information about the history of the HSR project to date, the *Final Program EIR/EIS for the Proposed California High-Speed Train System* (Authority and FRA 2005), and the environmental review process, including alternatives development and analysis.

4.1.2 Alternatives Analysis Agency and Public Participation (September 2009 to May 2010)

The Authority conducted a number of meetings throughout the alternatives analysis phase with agencies, the public, and small groups. These meetings included a series of technical working group meetings in Gilroy and Merced, eight public information meetings, a community workshop and panel discussion, and a Gilroy City Council study session, all held between September 2009 and May 2010. The purposes of these meetings were to explain the alternatives analysis process, share the results of preliminary studies, and receive feedback.

4.1.2.1 Preliminary Alternatives Analysis and Public Participation (June 2010 to March 2011)

Following the release of the Preliminary Alternatives Analysis Report on June 3, 2010, the Authority and its consultants held more than 80 meetings with elected officials and staff, other key stakeholders, and the public. These meetings included technical working group meetings in Gilroy and Merced. The San Jose to Merced Project Section team hosted meetings in Merced with representation and participation from the Merced to Fresno Project Section team. The Authority also held five public information meetings, a variety of stakeholder meetings, and two rounds of additional public outreach meetings in Gilroy and Morgan Hill between June 2010 and March 2011. More than 870 participants attended these public meetings.

4.1.2.2 Supplemental Alternatives Analysis and Public Participation (May 2011 to June 2011)

The Authority released the Supplemental Alternatives Analysis Report on May 5, 2011. This report documented additional and refined alignments and design options for the Morgan Hill and Gilroy, Pacheco Pass, and San Joaquin Valley Subsections developed in response to comments received on the Preliminary Alternatives Analysis Report.

Following issuance of the Supplemental Alternatives Analysis Report, the team held interagency meetings in Merced (May 2011) and Morgan Hill (June 2011). Public information meetings to review the report were also held in Gilroy, Merced, and Los Banos in May and June 2011.

4.1.3 Issues Raised during Early Project Phase Outreach

The following issues were consistently raised in these meetings (via verbal and written comments):

- **Consultation and outreach.** Commenters wanted to know with which local agencies the Authority was consulting. Commenters were interested in how public and agency input would be elicited and incorporated, including what type of comments were being solicited at the current stage of the study and how public and agency comments would be incorporated. Some commenters expressed concern that the engagement effort in Gilroy (particularly east of US 101), Morgan Hill, and the surrounding unincorporated area needed to be more comprehensive.
- **Support or opposition.** Commenters generally expressed support for HSR; however, some were concerned about the potential impact on homes. Some commenters expressed concern over the need for a HSR project. Some commenters indicated the Altamont Pass alignment would be a shorter route, would preserve more existing infrastructure, and would be less expensive than the route over Pacheco Pass.
- **Business plan (funding, ridership, and schedule).** Commenters expressed concerns about overall project funding, the decision-making timeline, and the age of the ridership figures. In addition, commenters wanted more information about the anticipated funding from the federal government and the cost differential of the various vertical profiles (tunnel, trench, at-grade, aerial) and horizontal profiles.
- **Right-of-way.** Commenters wanted to know the anticipated right-of-way acquisition requirements and planned coordination for right-of-way acquisition for the project as a whole.
- **Project operations.** Commenters asked for information about train operations, including hours of operation, frequency, and speed.
- **Alternatives.** In the San Jose area, commenters wanted to know the plan for coordinating the San Jose to Merced and San Francisco to San Jose Project Sections for planning and analysis of the San Jose Diridon Station. Additionally, commenters asked whether the Draft EIR/EIS would identify a preferred alternative. Commenters questioned the feasibility of the Altamont Pass crossing. Commenters requested consistency in the approach to addressing rail crossings in the San Jose to Merced Project Section and Merced to Fresno Project Section environmental documents.
- **Traffic impacts.** Commenters requested information on traffic impacts and the magnitude of the access road and temporary construction easements that would be required.
- **Environmental impacts and impacts on agricultural lands.** Commenters wanted to make sure that impacts on agricultural lands and operations would be addressed in environmental review. They expressed further concerns about impacts on wildlife and the environment.
- **Noise and vibration impacts.** Meeting attendees expressed concerns about noise and vibration impacts from both construction and operation of the project. Commenters discussed impacts of sound and electromagnetic waves on the environment and on animals.

The cities and communities along the project alignment expressed different concerns and priorities during these meetings. A summary of these concerns by city or community follows:

- San Jose
  - Noise and vibration impacts
  - Visual impacts
  - Impacts of local road closures on road network connectivity, access, and the proposed narrowing of Monterey Road
  - Eminent domain and impacts on property values

- Morgan Hill
  - Impacts on local roads, connectivity, access, and right-of-way, including specific inquiries as to whether Depot Street would be closed for the proposed grade separation between Dunne Avenue and Main Street
- Gilroy
  - Impacts on downtown Gilroy and neighborhoods
  - Impacts on local roads, connectivity, access, and right-of-way
- East of Gilroy
  - Visual impacts and changes in community character
  - Impacts on homes and quality of life
  - Impacts on agricultural lands
  - Reduced access to properties, decreased property values, eminent domain, and the property acquisition process
  - Noise mitigation
- Pacheco Pass (unincorporated Merced County)
  - Impacts on local roads, connectivity, access, and right-of-way
  - Construction impacts on Cottonwood Creek and Cottonwood Bay
- San Joaquin Valley (unincorporated Merced County)
  - Impacts on local roads, connectivity, access, and right-of-way
  - Impacts on agricultural lands and associated irrigation infrastructure
  - Impacts on dairy operations

4.2 Outreach Efforts during the Design Phase

Public outreach efforts were largely slowed between 2012 and 2016 as the Authority shifted priorities from the entire Project Section to accelerating a smaller subset—the Central Valley Wye Project Extent. Public outreach and targeted outreach to minority populations and low-income populations continued on the Central Valley Wye Project Extent, while limited outreach continued for the San Jose to Central Valley Wye Project Extent. The following section describes the engagement efforts during the current design phase, which was reinitiated in 2016.

4.2.1 Environmental Justice Outreach Plan

The Environmental Justice Outreach Plan (Outreach Plan) was created at the beginning of the current design phase in 2016 to "guide the Authority in engaging minority populations and low-income populations in the project study area to communicate project information, listen to and respond to community thoughts and concerns, and identify potential actions to mitigate any disproportionately high and adverse human health and environmental effects, including social and economic effects, on minority populations and low-income populations." The Outreach Plan is provided in Attachment A, Environmental Justice Outreach Plan.

4.2.2 Outreach Methods and Technology

In locations where minority populations, low-income populations, and other sensitive populations may be affected by the project, a variety of outreach activities were conducted to inform local community members of the project and its status; solicit the thoughts and concerns of the community regarding project impacts; and gain an understanding of the potentially adverse effects of the project on minority populations and low-income populations. These outreach efforts

used many formats, including public meetings, advertising and mailing of public notices, digital engagement, and direct outreach to stakeholders and community organizations through open houses, meetings, small group working sessions, and interviews. Additionally, the Authority set up information tables at community centers or events to answer community questions and sign up people to receive regular information about the project.

These outreach efforts considered all recommendations and factors for outreach included in the Authority's Title VI and environmental justice guidance, including:

- Consideration of the time, location, and accessibility of all meetings. This effort also includes encouraging meaningful participation of sensitive populations by using other means for engagement besides meetings, such as interviews, briefings, and the use of audio devices to record comments. In addition, all meetings include multiple notification methods, provision of interpreters, venue locations that are accessible (i.e., ADA compliant) and formats that provide for different ways to learn about the project alternatives and share feedback.
- Reaching people within their own communities and during existing meetings schedules using existing community groups and their knowledge of the community to more effectively reach minority populations, low-income populations, and sensitive populations. This effort includes selecting meeting locations that are culturally sensitive.
- Provision of interpreters to support persons with limited English proficiency at meetings. This includes provision of Spanish-speaking interpreters and translated meeting materials at Open House meetings hosted by the Authority, as well as notices in Spanish, Mandarin, Vietnamese, and Tagalog indicating interpreters can be made available by request.
- Presentations focused to specific interest groups.
- Placement of meeting announcements and flyers through different types of media and advertisement of meeting notices in Mandarin, Spanish, Vietnamese, and Tagalog to reach populations with limited English proficiency.
- Cultural sensitivity to minority and Native American tribal groups.
- Identification of barriers to public participation and ways to overcome those barriers.

4.2.2.1 Public Meetings

Numerous outreach events for the project have been held since the beginning of 2016. Outreach activities included presentations at public and stakeholder group meetings. Meeting locations were determined using the following approach:

- Coordinating with partners in the community who help with outreach and notification, and serve as a co-convener for the meeting
- Using a venue that community members are familiar with, that is accessible by sensitive populations, and where they feel comfortable, such as neighborhood centers and community facilities
- Identifying a venue close to the HSR alignment(s) and the impacted communities
- Targeting minority populations and low-income populations by referencing census data and overlaying it with the proposed alignments/areas of anticipated impacts

These outreach meetings have taken many different formats, including providing project updates to local elected officials during their meetings (e.g., City Council meetings), open houses, and presentations to neighborhood organizations. Many of these meetings were located in minority areas and low-income areas. Open house meetings were advertised with flyers providing information in multiple languages, including English, Mandarin, Spanish, Vietnamese, and Tagalog. A complete list of all public outreach meetings where information on the project was provided by the Authority can be found in Attachment B, List of Outreach Meetings Held for Project.

4.2.2.2 Digital Technology

One of the most successful ways to engage community members in discussions about a project is the use of high-definition aerial maps that show the proximity of different project elements to areas that are important to community members, such as their homes, businesses, and recreation areas. During the Authority-led open houses held in late April and early May 2017, freestanding digital terminals allowed community members to type in their addresses and look at the proximity of the different project alternatives.

4.2.2.3 Targeted Outreach to Stakeholder and Community Organizations

To inform the outreach efforts to minority populations and low-income populations, the Outreach Plan identified environmental justice and transportation advocacy groups that are active regionally or on a statewide scale, as well as stakeholders and community organizations that provide services to or represent minority populations and low-income populations in the environmental justice RSA. As such, several organizations that are headquartered outside of the RSA participated.

Table 2 shows the organizations specifically dedicated to environmental justice and transportation that were contacted during the reinitiated design phase. Attachment 1 of the Outreach Plan (Attachment A) presents a more extensive list of minority populations and low-income populations and organizations that serve those populations.

Table 2 Organizations Contacted

Organization Name	Description	Website
California Endowment	Statewide grant-making organization that promotes fundamental improvements in the health status of all Californians	http://www.calendow.org/
California Environmental Justice Alliance	Statewide, community-led alliance that works to achieve environmental justice by advancing policy solutions	http://caleja.org/about-us/vision-and-history/
California Pan-Ethnic Health Network	Statewide network that promotes health equity by advocating for public policies and sufficient resources to address the health needs of communities of color	http://cpehn.org/
California Rural Legal Assistance	Statewide environmental justice and legal aid program that provides low-income rural Californians with free legal assistance	http://www.crla.org/

Voices from the Valley	San Joaquin Valley-focused organization that offers a centralized media outlet for Central Valley activist organizations	http://www.voicesfromthevalley.org/

4.2.2.4 Interviews Related to Environmental Justice

An initial series of interviews was conducted in July and August 2016 with stakeholder organizations serving minority populations and low-income populations in the environmental justice RSA to inform the Authority's outreach efforts to these populations. The primary objectives of the interviews were to:

- Better understand the interests and concerns of minority populations and low-income populations and how they relate to the HSR project
- Inform the Authority's strategy for meaningfully engaging with minority populations, low-income populations, or both, including anticipating and responding to potential challenges
- Identify specific environmental justice outreach opportunities (e.g., events, meetings, neighborhood groups) and additional stakeholders with whom to partner moving forward

Table 3 shows the stakeholders that were interviewed. Interviewees noted that because minority populations and low-income populations have historically been burdened with disproportionately high and adverse effects from infrastructure projects in comparison to other communities, causing mistrust of government and doubts as to whether community input is being taken into consideration, a certain degree of mistrust of the Authority, as a government agency, is expected. They also highlighted that much of the project information is not provided in the first language of community members, and that members of minority populations and low-income populations often do not have the ability to participate in public engagement processes because of other, higher-priority life demands. The locations of these interviews in relation to the percent minority populations and low-income populations are mapped on Figure 1.

Table 3 Interviews with Stakeholder Organizations Conducted in 2016

City of San Jose District Three	San Jose	August 4, 2016
Delmas Park Neighborhood Association	San Jose	August 4, 2016
Sierra Health Foundation	Project Section	July 28, 2016

[1] While not specifically an environmental justice organization, California Environmental Protection Agency has an environmental justice program and provides guidance documents and grants for related work. The agency also provides information about minority populations and low-income populations in coordination with California Office of Environmental Health Assessment in the CalEnviroScreen tool.

Results of 2016 stakeholder interviews informed the Authority's strategy to engage minority populations and low-income populations in the environmental justice RSA in 2018 and 2019. To achieve a broader reach to focus communities along the project alignment, the outreach team engaged community-based service providers representing the interests of more than 46,000 community members, with the objectives of gathering feedback on impacts the project had on the

focus communities, and increasing community awareness and knowledge about the project. Stakeholders also offered suggestions on how to effectively engage communities along the project. These engagement suggestions included conducting in-language gatherings, neighborhood walks, and door-to-door canvassing in some neighborhoods; using social media and public service announcements on Spanish-language radio stations to engage Spanish-speaking residents; and providing incentives such as food and childcare at evening and weekend meetings.

These recommendations were incorporated into and continued to shape the targeted environmental justice outreach efforts conducted throughout 2018 and 2019. Authority staff made efforts to provide accommodations to address the stakeholders' suggestions and provide enhanced outreach whenever feasible by partnering with local organizations. For example:

- Authority staff joined local community leaders to conduct neighborhood walks and canvass door-to-door in select minority communities and low-income communities to answer community members' questions and provide information about the project. In San Jose's Gardner neighborhood, for example, the Authority coordinated the planning of an in-language community meeting with the neighborhood association. In advance of the early evening meeting held at the local community center, Authority staff canvassed in the neighborhood and informed members of the public that children and other family members were welcome. The neighborhood association provided refreshments.
- The Authority opted not to provide public service announcements on Spanish-language radio stations, but Authority staff enlisted local community organizations to translate and share information about events on the community organizations' social media postings, via emails and newsletters, and on their websites. For example, a large Vietnamese community foundation in San Jose hosted a presentation by Authority staff. They prepared a flyer about the event in Vietnamese and also provided a meal at the event to encourage participation.
- Multilingual flyers, in-language posters and newspaper ads, and community organizations' social media postings invited members of the public to the summer 2019 open houses regarding the preferred alternative. Based on stakeholder feedback, the outreach consulting team provided family-friendly snacks and a number of children accompanied adult members to these informal events.

Commencing in 2018, direct engagement with community members was coordinated with stakeholders serving minority populations and low-income populations with the intent of increasing awareness and participation in outreach activities conducted for HSR. Service providers served as partners and co-hosts for community outreach meetings and presentations. Several meetings included in-language material and translation services based on community members' needs as indicated by the service providers. In addition, the Authority focused outreach in communities where interviews with service providers indicated that community members lacked awareness of the project (e.g., in Gardner).

As a result of the addition of Alternative 4 in 2018, and the resulting interest from the relevant communities, a second series of interviews were conducted beginning in October 2018 and continuing through December 2019 with stakeholders serving minority populations, low-income populations, and sensitive populations in the environmental justice RSA to continue the Authority's outreach efforts to these populations. Table 4 identifies the stakeholders that were interviewed in 2018 and 2019.

APRIL 2021

Figure 1 Locations of Environmental Justice Outreach Activities

4.2.2.5 Environmental Justice-Focused Meetings and Other Events

The Authority scheduled and attended a number of meetings and events specifically intended to engage minority populations and low-income populations near the project to gather input on project alternatives. As a result of the addition of Alternative 4 in 2018, and the stakeholder service provider interviews detailed in Section 4.2.2.4, Interviews Related to Environmental Justice, the Authority refocused its efforts to reach minority populations and low-income populations beginning in mid-2018. The Authority also organized on-the-ground outreach, such as information tables and booths at local fairs and community events frequented by local residents. These locations were identified as an effective means to reach the minority populations and low-income populations in the environmental justice RSA and included locations such as flea markets, public libraries, and neighborhood meetings. The Authority provided the following outreach events:

- August 20, 2016: Information table at Gardner Community Flea Market, San Jose
- September 18, 2016: Information table at Viva CalleSJ community event with bilingual staff, San Jose
- October 20, 2016: Presentation to Gilroy Eliot School Community meeting, Gilroy
- October 27, 2016: Presentation at San Jose District 2 (Monterey Road area) Community Meeting, San Jose
- November 14, 2016: Meeting with local residents and City of Gilroy staff to discuss outreach strategies to communities and businesses in the downtown Gilroy area, Gilroy
- November 29, 2016: Information table at Edenvale Public Library, San Jose
- December 7, 2016: Presentation to Edenvale Great Oaks Plan Implementation Coalition, San Jose
- December 19, 2016: Information table at Gilroy Downtown Library, Gilroy
- February 1, 2017: Presentation to Seven Trees Neighborhood Association at regular meeting, San Jose
- February 13, 2017: Presentation to Gardner Neighborhood Association at regular meeting, San Jose
- March 8, 2017: Presentation to Goodyear-Mastic and Alma Neighborhood Associations at their joint meeting; the Tamien Neighborhood Association was also invited to attend, San Jose
- April 6, 2017: Information table at Gilroy Downtown Library with English-speaking staff and Spanish language translator, Gilroy
- April 17, 2017: Information table at Arteaga's Super Save Market with English-speaking staff and Spanish-language interpreter, Gilroy
- July 19, 2017: Presentation to the Gilroy Community & Neighborhood Revitalization Committee, Gilroy
- September 9, 2017: Presentation to United Neighborhoods of Santa Clara County Neighborhood Development Conference, San Jose
- September 11, 2017: Presentation to Senter Monterey Neighborhood Association, San Jose
- September 18, 2017: Presentation to Gardner Neighborhood Association, San Jose
- June 8, 2018: Gilroy right-of-way workshop, Gilroy
- July 2, 2018: Oak Grove Neighborhood Association meeting, San Jose
- August 14, 2018: Morgan Hill morning community meeting, Morgan Hill

- August 14, 2018: Morgan Hill evening community meeting, Morgan Hill
- September 20, 2018: Gilroy small business workshop, Gilroy
- September 24, 2018: Gilroy Unified School District and City Council Meeting, Gilroy
- October 18, 2018: San Martin Neighborhood Alliance meeting, San Martin
- October 23, 2018: Delmas Park Neighborhood Association meeting, San Jose
- March 6, 2019: Vietnamese Voluntary Organization (VIVO) (Vietnamese translation provided), San Jose
- March 26, 2019: Volta Elementary School Community Meeting (Spanish translation provided), Los Banos
- May 13, 2019: Gardner Neighborhood Association, Gardner
- May 28, 2019: Gilroy Community Meeting (Spanish translation provided), Gilroy
- May 31, 2019: Homeless Walks with HomeFirst along the Monterey Corridor, San Jose
- June 13, 2019: St. Joseph's Family Center Homeless Dinner, Gilroy
- June 14, 2019: Homeless Walks with PATH around Diridon Station, San Jose
- July 5, 2019: Morgan Hill Chamber of Commerce Music in the Park, Morgan Hill
- August 1, 2019: Presentation to the Good Morning Morgan Hill Chamber of Commerce Breakfast, Morgan Hill
- August 9, 2019: Information table at the Downtown San Jose Farmers Market, San Jose
- September 20-21, 2019: Information table at the Vietnamese Moon Festival, San Jose
- October 16, 2019: Ground-truthing (observing) outreach in communities around the Tamien Caltrain and Santa Clara Stations, San Jose and Santa Clara
- November 6, 2019: Community meeting with Better Tomorrow: San Jose
- December 13, 2019: Presentation at Gardner Academy, San Jose
- December 13, 2019: Gardner Neighborhood Walk, San Jose

The locations of these meetings are mapped on Figure 1.

Between January and April 2020, the Authority participated in 13 outreach events. As a result of the COVID-19 global pandemic, all meetings conducted in March and April 2020 were held virtually.

- January 28, 2020: Gilroy Unified School District Presentation
- February 1, 2020: Shasta Hanchett Park Neighborhood Association Fair
- February 1, 2020: Meet the Black Authors and Artists Event
- February 6, 2020: Santa Clara Unified School District Principals
- February 20, 2020: Guadalupe Washington Safety Coalition Community Walk
- February 20, 2020: Guadalupe Washington Neighborhood Association Presentation
- February 21, 2020: Family Fun Friday
- February 24, 2020: Emergency Assistance Network Presentation
- March 4, 2020: Oak Grove High School Latino Parents Meeting
- April 16, 2020: Franklin-McKinley School District Webinar

- April 19, 2020: Muslim Community Association Community Webinar
- April 21, 2020: Edenvale Great Oaks Plan Implementation Coalition Community Webinar
- April 23, 2020: Madre-A-Madre Community Webinar

4.2.2.6 Group Stakeholder and Community Working Group Meetings

The Authority reconvened community working groups (CWG) to discuss and gather input on project alternatives with community members representing a broad range of local interests. Each of the groups includes representatives of minority populations and low-income populations in the environmental justice RSA.

On September 13, 2016, Authority and consultant staff participated in a small group meeting with San Jose District 2 staff and City of San Jose staff to discuss outreach to residents along the Monterey Road corridor. Throughout 2017, Authority and consultant staff continued to meet regularly with City of San Jose staff to discuss public outreach.

As the Authority expanded environmental justice outreach efforts in 2018 and 2019, Authority staff coordinated with CWG members on how to best engage with minority populations and low-income populations in their communities. The topic of coordination served as a discussion prompt at some CWG meetings, and CWG members offered advice on coordination partners or advocated for activities and events to be conducted in specific neighborhoods.

As a result of this input, Authority staff worked closely with CWG members representing specific population groups to collaborate on environmental justice outreach activities targeting minority populations and low-income populations. For example, in San Jose, a CWG member facilitated the door-to-door canvassing and scheduling of a community meeting in the Gardner neighborhood. Another CWG member organized a meeting with representatives from the Vietnamese community.

To ensure CWGs reflect the diversity of stakeholders in the region, the Authority continues to add new CWG members by inviting contacts established through the environmental justice outreach process. As Authority staff engage with stakeholder organizations representing minority populations, low-income populations, and other marginalized populations, leaders of these organizations are invited to join the CWGs.

During the reporting period, the Authority conducted the following community working group meetings:

- April 14, 2016: Morgan Hill-Gilroy CWG
- April 18, 2016: Los Banos CWG
- August 9, 2016: Gilroy-Los Banos Technical Working Group (note: members of the Los Banos Community Working Group were invited to participate as members of this group)
- August 11, 2016: Morgan Hill-Gilroy CWG
- August 17, 2016: San Jose CWG
- January 23, 2017: San Jose CWG
- January 26, 2017: Morgan Hill-Gilroy CWG
- May 31, 2017: San Jose CWG
- July 12, 2017: San Jose CWG
- August 2, 2017: San Jose CWG
- August 30, 2017: San Jose CWG

- September 27, 2017: San Jose CWG
- October 26, 2017: San Jose CWG
- May 1, 2018: Business Plan Webinar with NorCal CWGs
- May 2, 2018: San Jose CWG
- August 16, 2018: San Jose CWG
- November 7, 2018: Morgan Hill-Gilroy CWG
- November 28, 2018: San Jose CWG
- February 21, 2019: San Jose CWG
- March 5, 2019: Morgan Hill-Gilroy CWG
- April 22, 2019: Morgan Hill-Gilroy CWG
- May 2, 2019: San Jose CWG
- July 10, 2019: Morgan Hill-Gilroy CWG
- July 16, 2019: San Jose CWG

While the Authority convened several CWGs along the San Jose to Merced Project Section between November 2019 and April 2020, these meetings were not focused on environmental justice topics, and they did not target environmental justice communities.

4.3 Outreach Efforts After the Release of the Draft EIR/EIS

The Authority published the San Jose to Merced Project Section Draft EIR/EIS on April 24, 2020. Since then, the Authority has conducted approximately 110 outreach meetings and events. As a result of the COVID-19 global pandemic, all meetings conducted between March 2020 and July 2021 were held virtually. The Authority did not host any in-person meetings during this time.

4.3.1 Environmental Justice Outreach Not Related to Community Improvements

Between the release of the Draft EIR/EIS and April 2021, the Authority conducted the following engagement and outreach activities not related to the community improvements planning process, which is discussed separately below.

4.3.1.1 Meetings During Draft EIR/EIS Public Review Period

During the public review period for the Draft EIR/EIS in April and May of 2020, the Authority met with several stakeholders and agencies, as listed in Table 5-12 of Final EIR/EIS Chapter 5, in addition to public webinars that were attended by members of the general public, as well as minority persons and low-income persons.

4.3.1.2 Public Meetings After the Draft EIR/EIS Public Review Period

While the Authority hosted three virtual public open houses and a virtual public hearing along the San Jose to Merced Project Section between May and October 2020, these events were not focused on environmental justice topics, and they did not target environmental justice communities. There were no Authority-hosted public meetings in the San Jose to Merced Project Section between November 2020 and April 2021.

4.3.1.3 Group Stakeholder Meetings

While the Authority convened several CWGs along the San Jose to Merced Project Section between May 2020 and April 2021, these meetings were not focused on environmental justice topics, and they did not target environmental justice communities.

4.3.1.4 Individual Stakeholder Meetings

Between the release of the Draft EIR/EIS and April 2021, the Authority conducted two meetings with the following people/organizations that covered topics related to environmental justice impacts and analysis that were not related to community improvements.

- August 12, 2020: San Jose City Councilmember Maya Esparza
- September 10, 2020: Santa Clara Unified School District

4.3.2 Environmental Justice Community Improvements Outreach

The environmental justice planning process includes several rounds of outreach related to improvements. The following sections describe the Authority's community improvements outreach efforts since December 2020, the results of which have been incorporated into the Final EIR/EIS.

4.3.2.1 Community Improvement Outreach, Phase One

After initial community improvement concept development, a first phase of improvements-focused outreach was conducted. The goals of this first phase of outreach (Outreach Phase One) were as follows:

- Expand the Authority's understanding of the needs of minority populations and low-income populations.
- Promote understanding of the environmental justice analysis and the process.
- Gather minority community and low-income community ideas for improvements.
- Obtain feedback on the initial list of improvements.

Presentations were made between December 2019 and March 2020 to a multitude of local minority community organizations and low-income community organizations, including community-based service providers, school leaders, community groups, neighborhood associations, churches and other faith-based organizations, and community leaders and representatives, along with public agency representatives. Participants were identified from the stakeholder database, and additional outreach was added as initial contacts led to subsequent and new contacts.

These first engagements were to provide information and data and to provide a process through which local minority community improvement concepts and low-income community improvement concepts would be developed. Information about the requirements for a federal environmental justice EIR/EIS analysis, finding of disproportionate effects, and subsequent need to identify minority community improvement concepts and low-income community improvement concepts was explained. Data about the identification, boundaries, and initial naming of the minority communities and low-income communities was shown graphically. The proposed improvements process with a structure for identifying, developing, and prioritizing improvement concepts across an 85-mile alignment was described. Other materials provided for review and consideration included the following:

- Sample community improvement concepts from national examples, the Authority's own factfinding as memorialized in the Connecting Community Strategy (CCS), and San Jose's Strong Neighborhood Initiative (SNI), of improvement implementation
- A template outlining the minimum data requirements for each improvement concept
- A preliminary list of criteria that ties the improvement concept to the USEO goals and objectives, accounts for engineering as well as cost feasibility, links potential partners, and bounds the improvement concept exercise to federal environmental justice requirements
- A preliminary list of community concept types, as well as specific concepts that were included in planning documents, capital improvement lists, and unfunded priorities
- Explanation of the goals of the improvements process to engage local minority communities and low-income communities to develop improvement concepts

- Criteria for rating the concepts were also presented because the criteria would allow the Authority to rank improvements across a 90-mile geography with a solid basis for differentiating among improvement concepts.

During this phase of outreach, which occurred between December 2019 and March 2020, the Authority conducted a total of 48 meetings, including calls and in-person meetings with potential partners and community presentations. Outreach during this phase included gathering feedback from potential implementing partners (i.e., those entities potentially able to partner with the Authority on improvement implementation). Potential implementing partners included school districts, cross-jurisdictional agencies, municipalities, and a few selected community organizations across the affected communities.

4.3.2.2 Community Improvement Development and Evaluation

Development and evaluation of potential improvements began following completion of Outreach Phase One and continued through June 2020. Improvements were developed based on input from potential partners and community stakeholders to ensure that improvements carried forward for funding and implementation would meet community needs and priorities. After development of improvements based on initial concepts gathered during Outreach Phase One, potential improvements were evaluated based on the set of established evaluation criteria.

Community Improvement Development

As part of preparation of the draft analysis, potential improvements in the initial concept development phase were developed, refined, consolidated, or in some cases eliminated to determine a set of improvements to be evaluated. Refinements included expanding potential improvement ideas by gathering additional information from existing local and regional plans where certain improvements were described more fully. Improvement development also assessed the benefits to minority populations and low-income populations, the relationship of each potential improvement to project effects, and the consistency of potential improvements with local plans and policies. Preliminary cost estimates were also prepared for each potential improvement. Further, to help gauge the extent to which a given improvement would benefit minority populations and low-income populations within a given community, each improvement was mapped relative to the location of the minority populations and low-income populations along the HSR alignment.

Evaluation of Community Improvements

After developing profiles for potential improvements, the improvements were evaluated relative to the refined set of evaluation criteria, described in Appendix 5-C, Environmental Justice Development of Community Improvements, of the Final EIR/EIS. The improvements evaluation informed the identification of potential community improvements address residual disproportionately high and adverse effects on minority populations or low-income populations.

4.3.2.3 Community Improvement Outreach, Phase Two

After completing the initial screening and evaluation of the improvement concepts and ideas gathered during Outreach Phase One, the Authority undertook a second phase of outreach to gather feedback from potential implementing partners on specific improvements to ensure that the improvement profiles correctly represent the input gathered during Outreach Phase One and collect any additional information pertinent to the potential improvements, such as the roles and responsibilities of the agencies and entities who would be involved in design and implementation of the improvements. Feedback was also sought on the scoring of the potential improvements, the ranking of improvements relative to local priorities, and the preliminary cost estimates included in the improvement profiles. During this phase of outreach, which occurred between July and September 2020, the Authority conducted a total of 17 meetings, including calls and in-person meetings with potential partners and community presentations. Feedback gathered during Outreach Phase Two was then incorporated into the revised analysis, which is included in the Final EIR/EIS.

To solicit this feedback, local jurisdictions and agencies and certain other nongovernmental organizations were presented with the improvement profiles pertinent to their communities, jurisdictions, or areas of focus, along with the preliminary scoring and evaluation of each improvement. The Authority scheduled meetings with potential implementing partners to discuss their perspectives on the improvement evaluation, to gather feedback, and to better understand local priorities. The Authority met with the following jurisdictions, agencies, and groups during Outreach Phase Two:

- City of Santa Clara
- City of San Jose (including the Parks and Recreation Department and the Department of Transportation)
- City of Morgan Hill
- City of Gilroy
- Local school districts (for school improvements in San Jose, Morgan Hill, Gilroy, and Los Banos)
- Santa Clara County Parks and Recreation Department (for County parks)
- Rebekah Children's Services (for improvements to the organization's facility)
- Rocketship Public Charter School (for improvements at a Rocketship Mateo Sheedy School)
- Valley Transportation Authority (for transit and certain other transportation improvements)
- Center for Employment Training, Mission College, Gavilan College (for the potential cross-community job training improvement and other improvements specific to these institutions)
- African American Community Service Agency (for improvements at the organization's facility)
- Santa Clara County Health and Human Services and HomeFirst (for homeless services and housing initiatives)

4.3.2.4 Draft Environmental Justice Improvements Analysis

Input gathered during Outreach Phase Two was incorporated into revised analysis in the Final EIR/EIS, which incorporates internal review, community partner feedback, and improvement evaluation results to present a list of potential improvement priorities. In particular, feedback related to the improvement profiles was considered to revise the descriptions of the potential improvements and to revise the scoring of each improvement to reflect partner input, priorities, and evidence of agreement.

4.3.2.5 Community Improvement Outreach, Phase Three

In the month of September 2021, the Authority conducted a total of 26 virtual meetings with Implementing Partners, Community Organizations, and Interested Parties and Other Stakeholders in eight communities, within the San Jose to Merced Project Section, including Santa Clara/North San Jose, San Jose Diridon, Gardner/North Willow Glen, Guadalupe/Washington/Tamien/Alma/Almaden, South San Jose, Morgan Hill, Gilroy, and San Joaquin Valley, where the EIR/EIS analysis had indicated that low-income populations and minority populations may be subject to disproportionately high and adverse effects from the project alternatives. Generally, the objectives of these meetings were to:

- Explain the updated environmental justice analysis for the EIR/EIS, including updated and new mitigations, consideration of benefits, and potential community improvements.
- Share preliminary conclusions related to the updated analysis.
- Gain feedback on the updated analysis, preliminary conclusions, and potential community improvements.

The Authority classified stakeholders engaged into three general categories: (1) Implementing Partners, (2) Community Stakeholders, and (3) Interested Parties and Other Stakeholders within each of the affected communities to share and discuss the analysis and provide an opportunity for feedback (See Attachment D for definitions of each category).

The Authority communicated closely with Partners, Stakeholders, and Others before the meeting series, sharing flyers, accommodation surveys, and proposed content. Each of the eight

communities received a community-specific and comprehensive packet of materials (in both Spanish and Vietnamese and were ADA-compliant) related to the environmental justice analysis, including:

- Community Survey
- Environmental Justice Analysis Process Summary
- Summary of Updates to the EIR/EIS Environmental Justice Analysis
- Environmental Justice Community Summary
- Meeting Agenda and Presentation

The Authority requested all review the materials and provide feedback via electronic survey, letter, or other written form by October 1, 2021. The feedback gathered during this phase has been evaluated and incorporated into the Final EIR/EIS. A detailed summary of outreach, outreach materials, and copies of the input from this outreach cycle are presented in Attachment D.

4.4 Key Issues Identified during Stakeholder Engagement

4.4.1 Prior to the Publication of the Draft EIR/EIS

The following issues and concerns were recurring during engagement efforts, including in areas with minority populations and low-income populations:

- **HSR alignments—**Participants provided input on how different project alternatives would avoid or adversely affect different neighborhoods and communities. Additional alignment preferences, such as an at-grade alignment through downtown San Jose, an alignment along US 101, or an alignment predominately in trench, tunnel, or along existing rail tracks, were suggested to minimize property impacts and community displacements.
- **Vertical profile—**Participants noted preferences for different vertical profiles and structure types for each project alternative. For example, residents noted that retained or elevated viaducts would reduce property acquisitions related to sloped embankments. Some stakeholders expressed preference for the aerial option approaching San Jose Diridon Station as a means of reducing potential noise and traffic effects, while others raised concerns regarding aesthetic changes and loss of privacy caused by aerial structures. Some San Jose participants suggested that the Authority consider “active uses” for underpasses of aerial structures, with the potential to provide community benefits and prevent homeless encampments.
- **Project-related noise—**Participants noted concerns about operation and construction-related noise impacts and asked about the location of noise barriers. Noise was raised as a key concern in most of the communities along the project, and was particularly important to residents in San Jose, who already experience noise effects because of Caltrain operations and the Norman Y. Mineta San Jose International Airport.
- **Traffic and transportation—**Participants noted concerns about traffic congestion resulting from project construction and operations. These concerns were raised most frequently in Santa Clara and San Jose, communities most affected by current commute traffic conditions. In San Jose, the primary traffic concern was associated with the lane reduction of Monterey Road, and resulting delays and diversion of local traffic. In Los Banos, community members reported the project construction and operations impacts were of most concern for the Volta Elementary School community. As there are only two access roads (e.g., Ingomar Grade and Henry Miller Avenue) for families to access the school, any road closures would disrupt school attendance and access to emergency services and any noise or other operations-related effects would interfere with the learning environment.
- **Safety and security—**Universally, participants raised concerns regarding safety associated with train speeds, road crossings, and pollution. In San Jose and Gilroy, particular concern

was expressed with regards to the safety of school children crossing the respective sections of Monterey Road; some individuals expressed the need for additional safety precautions. Issues of safety and security were also a concern for communities in the context of increased homeless encampments and illicit activities around the tracks and station areas. In many instances, there was concern for safety of families crossing tracks to access community and health services.

- **Aesthetic effects—**Participants, particularly those in San Jose, noted concern about visually dominant project elements and potential for graffiti on facilities, aerial structures, and noise barriers.
- **Community cohesion and connectivity—**Participants in the Newhall neighborhood of Santa Clara, the Willow Glen, Gardner, Edenvale, and Delmas Park neighborhoods of San Jose, Morgan Hill, San Martin, and Gilroy expressed concern that the project alignment would erode community cohesion and connectivity, as well as the existing community character.
- **Community resources—** San Jose residents voiced concern regarding effects on community resources, such as the segmentation and accessibility of parks and trails, including Fuller Park and Los Gatos Creek Trail, and noise effects at Gardner Elementary School. Residents in Morgan Hill and Gilroy were interested in property effects on schools located in minority areas and low-income areas within the environmental justice RSA (including the Charter School of Morgan Hill, Gilroy Preparatory School [a public charter school in the Gilroy Unified School District with both minority student percentages and low-income student percentages higher than the reference community], and South Valley Middle School). Residents in Gilroy were also concerned about potential effects of project-induced growth on Gilroy schools. Some Gilroy residents were concerned with effects on downtown Gilroy's historic district (under Alternatives 1 and 2), while others were concerned with effects on historic resources in Old Gilroy (under Alternative 3).
- **Displacements—**Participants voiced concerns related to the number and type of residential displacements, particularly in San Jose, Morgan Hill, and Gilroy. Participants raised concerns regarding the displacement of low-income rental housing, particularly in Gilroy and Morgan Hill, and the ability of low-income or unemployed community members who rent their housing to relocate if affected by HSR. Others expressed concern about whether adequate replacement housing and other zoned properties exist to relocate those affected. The Gilroy community is particularly concerned about Alternatives 1 and 3 impacts of complete displacement of schools, community and health resources and city facilities on IOOF Avenue, off of Monterey Road. The community has made efforts to find real estate to relocate the schools, resources, and facilities, and was unable to find suitable locations.
- **Affordable housing**—Gilroy and San Jose participants raised concerns regarding the effect of HSR on housing prices in the vicinity of stations and encouraged the Authority to adopt policies that protect and advocate for affordable housing in station areas.
- **Gilroy station location options**—Some Gilroy area residents were concerned with potential urban sprawl and induced-growth associated with a station in east Gilroy, which would have the potential to change the community character in the station area.
- **Construction effects on downtown Gilroy businesses—**A key concern raised by community members in downtown Gilroy was that construction effects would result in negative effects on the operation and margins of businesses in downtown Gilroy.
- **Property values—**Participants in all communities expressed concerns regarding project effects on property values and appropriate relocation compensation.
- **Agricultural business and employment effects—**Participants in unincorporated Santa Clara and Merced Counties expressed concern regarding the loss of useable farmland, parcel severance, and effects on farm operations and infrastructure (e.g., wells and irrigation systems). Concern was also expressed for the corresponding loss of agricultural employment opportunities because of the projects' effects on agriculture.

- **Cumulative neighborhood effects—**Participants expressed concerns over neighborhoods that have been historically affected by other transportation projects (e.g., the Gardner and Auzerais/Josefa neighborhoods and the construction of I-880 and US 101 freeways and subsequent widening; and the Silver Leaf and Sunspring neighborhoods, which are bordered by the Caltrain/Union Pacific Railroad (UPRR) railway and US 101). Morgan Hill participants expressed concern that the safety, noise, access to transportation and services and other impacts on the City's priority development areas or affordable housing projects built around the existing Caltrain station, greatly outweigh the benefits that the project would offer the community given that there is no station. This is especially the case for the Morgan Hill community, as one of the eligibility criteria for residents of Morgan Hill's priority development areas is that they are a no-vehicle household and are wholly reliant on public transportation for their mobility.

4.4.2 After Publication of the Draft EIR/EIS

The following issues and concerns were recurring during engagement efforts, including in areas with minority populations and low-income populations, after the public had an opportunity to review the Draft EIR/EIS:

- **Project Timeline/Sequencing/ Process—**Interest in project timeline (e.g., alternative selection, implementation, and project phases).
- **General Impacts**
  - Based on the September 2021 survey, project impacts on average identified as being moderately concerning (construction and operational traffic, bus transit delay, residential displacements, emergency vehicle response delays, operational noise) and a few project impacts on average identified as being somewhat concerning (visual aesthetics, commercial displacements, and partial acquisition of park/play areas). The highest rated impact of concern was traffic delay during construction. The lowest rated impact of concern was visual aesthetics.
- **Displacement/Property Impacts**
  - Concern regarding loss of homes, parks, and churches to the project.
  - Interest in understanding the property acquisition process and options that owners have.
  - Concern that displacement challenges would hit lowest income families the hardest.
  - Concern that property, owned by the Authority and neighbors, would be tagged and lead to heightened gang activity.
- **Coordination with External Agencies and Organizations**
  - Recommendation for the Authority to partner with local community-based organizations (e.g., homeless response teams, Complete Streets programs) on programs.
  - Recommendation for the Authority to partner with community members on beautification efforts (e.g., tree planting).
  - Interest in the relationship and coordinating logistics between the Authority and other transportation providers, especially UPRR and Caltrain.
- **Funding—**Interest in understanding how the project moves forward while funding is still pending.
- **Noise/Vibration**
  - Concern regarding noise and vibration impacts of train operation and construction.
  - Interest in approaches to and effectiveness of noise mitigation.

  - Concern regarding potential repetition of past transportation projects' unfulfilled promises to produce sound walls.

- **Train Stations—**Concern regarding traffic congestion and availability of parking near stations.
- **Traffic**
  - Interest in potential project outcomes that lead to reduced traffic congestion.
  - Concern about increased traffic impacts on safety and accessibility.
- **Mitigation Measures**
  - Concern about effects unable to be mitigated (e.g., displacement, environmental degradation).
  - Interest in understanding mitigation timeline, requirements, and process.
  - Concern, based on reported past experience with other agencies, that Authority may plan but not deliver mitigation.
- **Community Improvements**
  - Interest in improvements projects (e.g., traffic calming features, such as pedestrian crossing signs, crosswalks, bike lanes; freeway ramps; fences; playgrounds; school improvements; parks; riverside paths).
  - Concern that project impacts and improvements benefits cannot fully be understood when projects in the vicinity are still being planned.
  - Concern that there will be unintended consequences of improvements (i.e., new fences to tag resulting in heightened gang activity).
  - Concern about criteria used to define "environmental justice" communities along the alignment.
  - Different community improvements than those on the Authority's September 2021 "potential improvements" list were proposed by close to half of the partners and stakeholders; some explained reasons for justifying improvements as a result of a close relationship to the impacts based on the updated analysis, and others proposed reasons that would serve their community better than the ones on the potential list.
  - Concerns that more should be done than is currently being proposed to address noise, traffic, and emergency response effects.
  - Consistent concerns about the project's effect on homeless encampments, specifically in the Tamien/SR 87 area.
  - Urged consideration of actionable/sustainable improvements to show understanding and responsiveness to community.
  - Concern that improvements may not be implemented sooner, prior to project construction.
- **Project Benefits and Equity**
  - Concern that the environmental process does not necessarily focus on prioritizing communities and protecting the interests of residents.
  - Interest in project benefits, especially improved air quality, access to lower cost housing, traffic reduction, job access, and the connection of families.
  - On average, based on the September 2021 survey, project benefits were seen as moderately beneficial for most highlighted benefits in the survey (train travel; access to

jobs, goods, and services; integration with transit; reduction of highway traffic; upgrades to railroad safety and signaling systems; reduced air pollution and greenhouse gas emissions; construction and operational spending and employment; and support for transit-oriented development near stations) with one benefit (reduced need for airport and highway expansion) rated as somewhat beneficial. The highest rated benefits were reduced air pollution and greenhouse gas emissions. The lowest rated benefit was the reduced need for airport and highway expansion (which was still 3.2 on a 5-point scale).

- **Community Cohesion/Separation/Connectedness**
  - Concern about community isolation.
  - Interest in project benefit of increased mobility that will keep families connected.
- **Public Awareness/Outreach Engagement**
  - Concern regarding a perceived lack of responsiveness by the Authority to community concerns.
  - Concern regarding the community's lack of awareness or limited knowledge about the project.
  - Interest in learning about commuter fares, requirements to ride (i.e., identification), and train schedules and volumes.
  - Interest in the activities and logistics (e.g., open houses, access for those with technological constraints) and methods for engaging stakeholders for the Draft EIR/EIS comment period.
- **Safety**
  - Interest in collaborating with homeless response teams to abate the homeless population and activities along the tracks.
  - Concern regarding emergency vehicle response times and ensuring public safety personnel have direct access to communities.
  - Interest in developing and maintaining safety features (e.g., grade separations, pedestrian overcrossings, traffic safety, pedestrian crossing signs and lights, secure fencing around tracks, lights near new structures).
- **Alternatives**
  - Interest expressed for underground alternatives.
  - Interest in understanding cost differences and displacement effects of each alternative.

For more information about these public engagement meetings and activities, see Attachment C, Biannual Environmental Justice Outreach Reports, which contains twice-yearly reports summarizing these meetings and Attachment D, Environmental Justice Outreach, September 2021.

5 ONGOING ENVIRONMENTAL JUSTICE ENGAGEMENT ACTIVITIES

The Authority has been engaging and is continuing to engage with minority populations and low-income populations as well as services that serve these populations to identify the concerns of individuals about the effects of the project. The Authority will continue to engage with communities and individuals that would be affected by the project after release of the Final EIR/EIS and after adoption of the Record of Decision to implement commitments made during the NEPA and CEQA review process, to manage construction and operational effects on minority populations and low-income populations, and to ensure equitable participation in the benefits of the HSR project.

1 HIGH-SPEED RAIL AND ENVIRONMENTAL JUSTICE

In compliance with U.S. Presidential Executive Order (USEO) 12898 *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations,* requiring the avoidance or mitigation of disproportional health and environmental effects on environmental justice populations, the California High-Speed Rail Authority (Authority) develops environmental justice outreach plans for each High Speed Rail (HSR) Project Section. Title VI of the Civil Rights Act of 1964, as amended, states that "no person in the United States shall, on the grounds of race, color, or national origin, be excluded from participation in, be denied the benefit of, or be subjected to discrimination under any program or activity that receives Federal financial assistance." Environmental justice, as mandated by USEO 12898, falls under the umbrella of Title VI. USEO 12898 states that "each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations in the United States." USEO 12898 has been adopted as a planning process requirement for all Authority efforts (Authority 2016).

The Authority's definition and application of the term "environmental justice" as it relates to the HSR system is as follows:

> *"Environmental Justice (EJ) is the fair treatment of people of all races, cultures, and income with respect to the development, adoption, implementation and enforcement of environmental laws and policies. Implementation of environmental justice principles in how the Authority plans, designs, and delivers the high-speed rail projects means that [the Authority] recognizes the potential social and environmental impacts that project activities may have on certain segments of the public. [The Authority] recognizes how important provisions of existing environmental, civil rights, civil, and criminal laws may be used to help reduce environmental impact in all communities and environmental justice on the human element. The Authority has included environmental justice considerations in its planning for the statewide high-speed train system since 2000, when it commenced a programmatic environmental review process"* (Authority 2015).

1.1 Overview

This *Environmental Justice Outreach Plan* is prepared to support the environmental study for the San Jose to Merced Project Section (Project Section) of the California HSR program. It is intended to guide the Authority[1] in engaging low-income and minority populations in the resource study area (RSA)[2] to communicate project information, listen to and respond to community thoughts and concerns, and identify potential actions to mitigate any disproportionately high and adverse human health and environmental effects, including social and economic effects, on low-income and minority populations.

The *San Jose to Merced Project Section Draft EIR/EIS* will be a stand-alone, second-tier, project environmental document. The report focuses on the portion of the Project Section between San Jose and Carlucci Road (San Jose to Central Valley Wye project extent, or simply project extent). The San Jose to Central Valley Wye project extent has a length of approximately 91 miles. Beginning at Scott Road, north of San Jose Diridon Station, the corridor primarily follows Monterey Road, U.S. 101, and SR 152 through Pacheco Pass. Desktop research, field surveys, and impact analyses in resource-specific technical reports for this project extent would terminate at Carlucci Road. The Draft EIR/EIS will summarize and include the analysis in the Central Valley Wye Project Section and the Ranch Road Re-examination to extend the corridor to Merced.

The infrastructure and systems of the HSR system would consist of trains (rolling stock), tracks, stations, train control, power systems, and maintenance facilities. The design includes a double-track rail system to accommodate planned project operational needs for uninterrupted rail movement. The system would be

[1] In the context of this plan, *Authority* refers to the California High-Speed Rail Authority or its consultants.

[2] The San Jose to Merced Project Section extends from Scott Boulevard in Santa Clara on the Caltrain Corridor to Carlucci Road and Henry Miller Road in central San Joaquin Valley, northeast of Los Banos. The resource study area (RSA) for environmental justice is concurrent with this area. See Figure 1 for a map of the RSA.

grade-separated from all other transportation systems, with two exceptions: the at-grade alternative at Auzerais Avenue and the at-grade alternative at Virginia Street, both in the San Jose Diridon Station Subsection.

The conceptual design of the station areas (Santa Clara, Diridon, and Gilroy) provides connectivity for different types of transit, drop-off facilities, an entry plaza, a station house area for ticketing and support services, an indoor station room where passengers wait and access the HSR, and parking facilities. Station design has not progressed beyond the conceptual stage, but two locations have been identified near Gilroy to accommodate two proposed corridor alignments. One co-located light maintenance facility (LMF)/maintenance of infrastructure facility (MOIF) would be located in the Gilroy area, and a maintenance of wayside (MOWS) would be located west of Turner Springs Road in the Central Valley.

Surveys and environmental assessments of the San Jose to Merced Project Section were initiated in 2010, and administrative draft reports were completed; however, work on the Project Section was suspended prior to completing the technical reports and the administrative Draft EIR/EIS. Since that time, the Authority has continued to refine the alternatives and limits of construction for this Project Section. The Authority identified the project footprint in summer 2016. From this footprint, the Authority has developed a concise project definition. Technical analysis, station design, and outreach was ongoing through 2016 and the EIR/EIS analysis is underway.

The Authority requires that an environmental justice outreach plan be developed and implemented as part of the Draft EIR. This *Environmental Justice Outreach Plan* provides the following information:

- Summarizes demographics in the RSA and community groups that are stakeholders in the project.
- Describes the strategy for reaching out to, engaging, and gathering input from low-income and minority populations.
- Identifies the specific methods that will be used to implement this strategy, such as digital media, information booths, and presentations to and listening posts with environmental justice advocacy and community groups.
- Lists the documents that will be prepared to document the environmental justice outreach efforts.

The process and guidelines described in this plan are provide a consistent method for sharing information with low-income and minority populations during the environmental review process for this project extent.

1.2 Regulatory Setting

The Authority has a strong commitment to ensuring that no person shall, on the grounds of race, color, national origin, sex, age or disability be excluded from participation in, be denied the benefits of, or be otherwise subjected to discrimination under any program or activity in the design, construction and operation of the high-speed rail system. Accordingly, the Authority adopted a Title VI programmatic policy that pays careful attention to the needs of limited English proficiency (LEP) and environmental justice populations (Authority 2016).

The following text details additional applicable regulations, requirements, and federal efforts that govern and inform the development and implementation of an environmental justice outreach plan.

1.2.1 U.S. Presidential Executive Order 12898

According to USEO 12898 Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, projects that receive federal funding should “ensure the full and fair participation by all potentially affected communities in the decision-making process; to avoid/mitigate disproportionately high human health or environmental effects, including social and economic effects, on low-income and minority populations; to prevent the denial of, reduction in, or significant delay in the receipt of benefit by minority populations and low-income populations.” Environmental justice populations, as identified by USEO 12898, comprise Black, Asian American, Native American, Hispanic/Latino (regardless of race), and low-income persons.

To emphasize the importance of USEO 12898, the Obama Administration facilitated a multi-agency signing of the Memorandum of Understanding on Environmental Justice and USEO 12898 in 2011

(Environmental Justice MOU). On the 20th anniversary of the original executive order, President Obama issued a Presidential Proclamation further solidifying the Administration's commitment to environmental justice. The document states that communities historically burdened by pollution—particularly minority, low income and tribal communities—merit protection from environmental and health hazards, access to the federal decision-making process, and access to a healthy environment in which to live, learn, and work. The environmental justice MOU increases federal agency accountability to environmental justice populations and outlines processes to aid overburdened communities and facilitate community engagement in agency decisions.

1.2.2 U.S. Presidential Executive Order 13166

In 2000, President Clinton issued USEO 13166, which provided additional federal guidance about providing information and services to LEP persons. Under USEO 13166, each federal agency is required to examine the services it provides and develop and implement a system by which LEP persons can meaningfully access those services consistent with, and without unduly burdening, the fundamental mission of the agency. Each federal agency must also work to ensure that recipients of federal financial assistance provide meaningful access to their LEP applicants and beneficiaries. To assist the agencies with this endeavor, the Department of Justice has issued general guidance on compliance standards that recipients must follow to ensure that the programs and activities they normally provide in English are accessible to LEP persons and do not discriminate on the basis of national origin in violation of Title VI of the Civil Rights Act of 1964, as amended, and its implementing regulations.

According to the December 2015 USEO 13166 accomplishment report (LEP.gov 2015), federal agencies continue to improve implementation of the USEO 13166 with new tools, training, and resources; stronger coordination; integrated use of data and technology; increased technical assistance; and improved outreach and education.

Accordingly, the Authority provides LEP access, at a minimum, to individuals who are representative of more than 5 percent of the population in California or the county in which the Authority is providing an activity or service.

1.2.3 U.S. Department of Transportation Order 5610.2(a)

The U.S. Department of Transportation (USDOT) Order 5610.2(a) is used by USDOT to comply with USEO 12898. USDOT Order 5610.2 generally describes the process that the Office of the Secretary, and each operating administration within the USDOT, will use to incorporate environmental justice principles (as embodied in USEO 12898) into existing programs, policies, and activities. The order requires the Office of the Secretary, and each operating Administration within USDOT, to develop specific procedures to incorporate the goals of USDOT Order 5610.2 and USEO 12898 with the programs, policies, and activities that they administer or implement.

1.3 Project Section Demographics

For this Project Section, the Authority would provide HSR service between San Jose Diridon Station in downtown San Jose, to a Gilroy station in either downtown Gilroy or east of Gilroy, and a station in downtown Merced. The San Jose to Central Valley Wye project extent would connect San Jose to the Central Valley portion of the HSR system at the Central Valley Wye in Merced County, which in turn connects to the portion of the system running north to Merced and south to Fresno and southern California (Figure 1).

Because the portion of the Project Section between Merced and Carlucci Road has been analyzed in the *Merced to Fresno Section Final EIR/EIS* (Authority and FRA 2012) and the *Merced to Fresno Section: Central Valley Wye Draft Supplemental EIR/EIS* (Authority and FRA no date), the analysis in this document focuses on the project extent between Scott Boulevard and Carlucci Road (San Jose to Central Valley Wye project extent).

Source: Authority and FRA 2016 JULY 2017

Figure 1 Proposed San Jose to Merced Project Section

Based on the 2010-2014 American Community Survey 5-year estimates for Santa Clara, San Benito, and Merced counties, San Benito County had the highest Hispanic/Latino population of the three counties. In Gilroy, more than half of the population was Hispanic/Latino. In 2014, Morgan Hill and San Martin were predominantly white while Gilroy and San Jose had the largest minority populations—approximately 68.5 and 72.5 percent minority, respectively. Morgan Hill was the least racially and ethnically diverse city, with only 50.7 percent minority representation. Table 1 shows the ethnic composition of the three-county region in 2014.

Table 2 shows other regional characteristics regarding income, age, and households. To account for the high regional cost of living in Santa Clara County, the poverty level metric that defines low-income populations for Santa Clara County and its cities has been set at 200 percent of the federal poverty level. As a result, all of the cities identified in Table 2 have a higher rate of low-income individuals than the 16.4 percent statewide average. Within the three-county region, Gilroy has the highest percentage of individuals below poverty level.

Table 1 Resource Study Area Ethnic Composition in 2014

Geographic Area	2014 Population	Percentage of Population (%)							
		Hispanic or Latino	Not Hispanic or Latino						
			White	African American	Native American	Asian	Native Hawaiian/Pacific Islander	Other Race	Two or More Races

[a] For this geography, the low-income level is set at the federal poverty level.
[b] For this geography, to account for the high cost of living, the low-income level is set at 200% of the federal poverty level.

2 ENVIRONMENTAL JUSTICE ADVOCACY AND COMMUNITY GROUPS

The following lists inform the outreach efforts to low-income and minority persons.

- Environmental justice and transportation advocacy groups that are active regionally or on a statewide scale (Table 3).
- Stakeholders and community organizations that provide services to or represent low-income and minority persons in the RSA (Attachment 1).

These organizations and groups advocate on behalf of low-income and minority populations in the RSA and are potential audiences for targeted outreach efforts. Table 3 lists organizations specifically dedicated to environmental justice and transportation, whereas Attachment 1 presents a more inclusive list of low-income and minority populations and organizations that serve those populations. As outreach continues, additional groups may be identified and added to either outreach list. An environmental justice database will be developed and updated periodically to track organizational contacts and outreach efforts.

Many of the environmental justice organizations shown in Table 3 advance environmental justice causes and advocate for minority or low-income populations in the RSA in addition to serving a broader geography. As such, several organizations are headquartered outside of the RSA.

Table 3 Environmental Justice and Transportation Advocacy and Community Groups Active in the Resource Study Area

Organization Name	Description	Website
California Endowment	State-wide grant-making organization that promotes fundamental improvements in the health status of all Californians	http://www.calendow.org/
California Environmental Justice Alliance	Statewide, community-led alliance that works to achieve environmental justice by advancing policy solutions	http://caleja.org/about-us/vision-and-history/
California Pan-Ethnic Health Network	State-wide network that promotes health equity by advocating for public policies and sufficient resources to address the health needs of communities of color	http://cpehn.org/
California Rural Legal Assistance	State-wide environmental justice and legal aid program that provides low-income rural Californians with free legal assistance	http://www.crla.org/
California Wellness Foundation	State-wide grant-making organization that addresses the particular health needs of traditionally underserved populations, including low-income individuals, people of color, youth and residents of rural areas	http://www.calwellness.org/
Center on Race, Poverty, and the Environment	San Joaquin Valley-focused environmental justice organization that seeks to achieve environmental justice and healthy, sustainable communities through collective action and the law	http://www.crpe-ej.org
Central California Environmental Justice Network	San Joaquin Valley-focused environmental justice network focusing on uniting activists and working with community members and stakeholders at local, regional, state and federal levels to eliminate environmental degradation in Valley Communities	http://ccejn.wordpress.com/

Organization Name	Description	Website
Central Coast Alliance United for a Sustainable Economy	Community organizing and advocacy organization that seeks to build grassroots power to invoke social, economic and environmental justice for the people of California's Central Coast Region	https://causenow.org
Central Valley Air Quality Coalition	San Joaquin Valley-focused coalition that works to ensure that all communities, of all races, cultures, class or creed, have the opportunity to be involved in the policy development and regulatory processes improving regional health	http://www.calcleanair.org/
Greenbelt Alliance	Bay Area-focused organization that seeks to protect natural and agricultural lands and shape the rules that govern growth around the San Francisco Bay Area	http://www.greenbelt.org/
Leadership Counsel for Justice and Accountability	San Joaquin Valley-focused, community-organizing advocacy group that seeks to affect land use and transportation planning, public investment priorities, environmental policy, and the provision of basic infrastructure and services	http://www.leadershipcounsel.org/
Policy Link	National research and action institute that advances economic and social equity by “Lifting Up What Works”	http://www.policylink.org/
Rural Community Assistance Corporation	State-wide organization that provides training, technical/financial resources and advocacy for rural communities	http://www.rcac.org/home
The City Project	National organization that works to ensure that all people have access to healthy, livable communities	http://www.cityprojectca.org/
TransForm	Transportation organization that seeks to transform communities and transportation with new solutions, smarter investments, and better planning as well as improve community access, health, justice, and sustainability	http://www.transformca.org/
United Farmworkers	A national farmworker’s union and social justice organization that seeks to provide farm workers and other working people with the inspiration and tools to share in society's bounty	http://www.ufw.org/
Valley Improvement Projects	San Joaquin Valley-focused organization that seeks to improve the quality of life for underrepresented and marginalized residents of California’s Central Valley by promoting social and environmental justice issues through youth outreach, education, technology, and art	https://valleyimprovementprojects.org/
Voices from the Valley	San Joaquin Valley-focused organization that offers a centralized media outlet for Central Valley activist organizations	http://www.voicesfromthevalley.org/

3 ENVIRONMENTAL JUSTICE OUTREACH

In locations where low-income and minority populations could be affected by construction or operations of the project extent, outreach activities will be conducted to solicit community views on the project's potential impacts. The purposes of these outreach activities are to inform local community members of the project and its status; solicit input on thoughts and concerns; and gain an understanding of potentially adverse project effects on low-income and minority communities.

The Authority used demographic and income information to identify minority and/or low-income populations in the RSA. As discussed in Section 1.3, Project Section Demographics, the RSA includes substantial low-income and minority, particularly Hispanic, populations. According to the National Center for Health Statistics (2015), low-income and specific minority populations such as Hispanics are more likely to be dependent on smartphones than on landlines. Similarly, according to the Pew Research Center (2015), low-income and Hispanic populations are more likely to rely on smartphones over computers for internet connectivity.

In order to engage low-income and minority groups in the RSA in the development of the environmental analysis, higher-resolution demographic data have been analyzed to identify key low-income and minority populations and interview environmental justice advocacy and community groups to inform the outreach techniques used to engage these populations. Outreach activities are documented as they occur for inclusion in the Draft EIR/EIS Environmental Justice chapter.

Continued outreach[3] will be needed in low-income and minority populations to provide information about the HSR decisions currently under consideration (Section 1.1, Overview), as well as to address any potential impacts on low-income and minority populations. The low-income and minority populations will also be provided with updates on the entire statewide system, including key milestones and progress. This environmental justice outreach will serve to open lines of communication to gather environmental justice population input and insights on project actions, potential ramifications, and potential mitigation strategies. This information will then be used to inform key decision-making.

3.1 Outreach Strategy

The Authority is committed to implementing a comprehensive outreach program that reaches a broad array of interests throughout the RSA. The Authority will follow the Department of Justice LEP guidance to confirm that information about the project is accessible to LEP persons in the RSA.

The outreach strategy outlined below will be used to engage key environmental justice stakeholders during the project development and environmental review processes. All outreach efforts will be conducted in coordination with the Authority's Northern California Regional Director and the Authority's Offices of Communication and Legislation.

Following are the key strategic objectives of this environmental justice outreach plan:

- Identify and actively engage environmental justice advocacy and community groups and elected officials representing low-income and minority populations throughout the RSA. Provide structured and unstructured opportunities for these groups and officials to provide input.
- Provide clear, concise, and accurate information, in appropriate languages, regarding this Project Section and the development of the environmental impact report (EIR)/environmental impact statement (EIS).
- Identify and address any potential environmental impacts disproportionately borne by low-income and minority populations throughout the RSA.

[3] From 2008 to 2010, the Authority conducted an extensive series of stakeholder meetings in the study area to discuss the project's scoping phase. The stakeholder meetings included minority and low-income populations, and several stakeholder workshops offered translation services and presentations in Spanish.

- Develop and implement multiple avenues of communication for environmental justice stakeholders to receive project information and submit questions and comments (e.g., public meetings, group presentations, activity centers, project website, bilingual hotline).
- Facilitate constructive dialogue between key environmental justice stakeholders and the Authority. Communicate back to low-income and minority populations how feedback has been reflected in the process.
- Communicate the vision, purpose, and benefits of the California HSR system.
- Accurately document and respond to all public input received and meet all CEQA and National Environmental Policy Act (NEPA) requirements.

To achieve the above strategic objectives, the Authority will adhere to the following outreach best practices:

- Proactivity: outreach to low-income and minority populations should happen “early and often” to identify and address environmental justice concerns as far in advance of potential effects as possible.
- Inclusivity: offer early and continuous opportunities for input on project advancements to as broad a spectrum of impacted or interested stakeholders as is feasible.
- Sensitivity: be informed and aware of low-income and minority population sensitivities and historical experiences and relationships; consider these sensitivities in information sharing approaches and techniques.
- Consistency: ensure all presentations, written/visual messaging, and informal conversations are presenting the same information.
- Accessibility: ensure meeting times and locations are accessible to target audiences, prioritizing locations where low-income and minority populations frequent and feel most comfortable and times when they are available, and tailor outreach materials and distribution methods to maximize target audience reach by offering translation services that meet or exceed LEP standards.
- Follow-Through: follow up with stakeholder comments and concerns to the best extent feasible.

3.2 Outreach Activities

Table 4 outlines potential outreach activities the Authority could conduct to engage low-income and minority populations in this project extent. Activities will be vetted before implementation by both Authority staff and environmental justice advocacy and community groups to confirm that they will reach the intended audiences.

Table 4 Public Participation and Outreach Examples

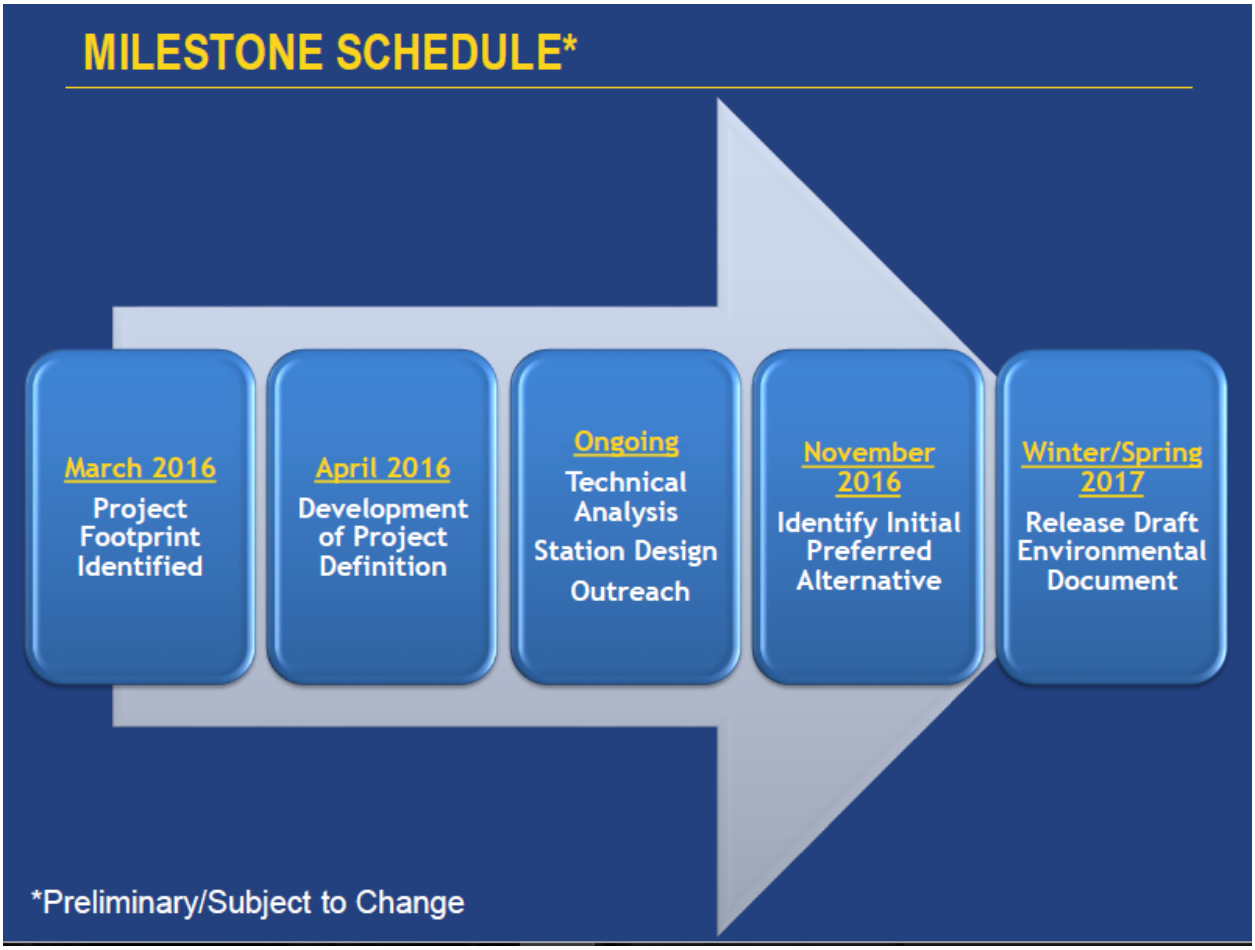
Example Outreach Category	Target Audience	Example Outreach Activity	Intended Outcome
Public meetings	All HSR stakeholders	Host periodic public meetings on the EIR/EIS HSR process in the RSA and solicit public comment	Disseminate key Authority EIR/EIS updates and receive suggestions and feedback via conventional public meetings
Organizational stakeholder contact	Environmental/social justice organizations	Connect with environmental justice advocacy and community groups to gauge their interest in scheduling meetings to offer project suggestions and inform stakeholder outreach processes	Establish a direct line of communication and a credible reputation with influential environmental justice advocacy and community groups who work in the RSA; gather valuable local insights on environmental justice challenges
Local stakeholder contact	RSA stakeholders, especially low-income and minority populations	Provide HSR tables and booths at local fairs and community events	Directly engage members of low-income and minority populations in HSR conversations to share relevant information, answer questions, and listen to perspectives; establish a two-way line of HSR communication in affected communities
Group stakeholder meetings	Multiple stakeholder agencies/ organizations	Organize meetings with multiple RSA advocacy and community groups and host collaborative, round-table discussions on HSR planning and key decisions	Gather and record topical HSR information as it pertains to low-income and minority populations to inform HSR processes
Digital engagement	RSA stakeholders, especially low-income and minority populations	Provide opportunities to participate, learn and provide input via online and mobile options	Directly engage members of low-income and minority populations in HSR without requiring in-person participation or home/office Internet access

HSR = high=speed rail
EIR/EIS = environmental impact report/environmental impact statement
RSA = resource study area

3.3 Outreach Implementation

The following sections present a general implementation approach for the environmental justice outreach strategy. Section 3.3.1, Public Meetings, reviews San Jose to Merced-specific events, or other relevant events organized and hosted by the Authority in which low-income and minority populations or organizations are invited to participate, receive updates, and/or offer feedback. Section 3.3.2, Environmental Justice Group Events and Meetings, reviews an approach to scheduling outreach events at which an HSR outreach representative would share relevant information with target low-income and minority population groups and gather insights from event attendees through any number of activities, such as tabling at public events or presenting to local organizations. Information gathered during these events will inform the HSR decision-making process.

Project milestones, illustrated on Figure 2, include project definition, scoping, technical analysis, identification of preferred alternative, and release of draft environmental document. Outreach efforts will be coordinated to meet these project milestones. Importantly, an environmental justice outreach implementation plan will be developed in concert with this document that will detail outreach specifics including targeted environmental justice populations, calendared events, outreach objectives, and strategies by environmental justice population and event, and outreach tracking and metrics. The implementation plan will be informed by higher-resolution demographics data as well as insights from environmental justice advocacy and community groups.



Source: Authority 2016

Figure 2 Draft Milestone Schedule for San Jose to Merced Project Section

3.3.1 Public Meetings

The Authority and its outreach team will schedule, coordinate, and facilitate public meetings, open houses and environmental review milestone meetings. These meetings will specifically include environmental justice advocacy and community groups to discuss any potential environmental impacts to low-income and minority populations in the RSA.

Meeting notifications may be distributed to the established list of environmental justice advocacy and community groups via email distribution and social media outlets. Advertisements may be placed in local non-English newspapers as determined by local demographics, and mail invitations may be distributed.

The Authority and its outreach team will secure all venues and coordinate logistics for each public meeting. Project fact sheets, welcome sheets, comment sheets and graphic displays will be developed and made available at every meeting.

All public meetings will be advertised and hosted per the requirements and best practices set forth by the Authority, including Title VI and LEP requirements (Authority 2016). These practices include offering translation services at public participation events. The Authority will provide translations of key documents such as comment cards and the draft EIS/EIR for LEP individuals who represent a significant population percentage of the geography in which the Authority is providing an activity or service. LEP regulation requires translation services to be offered when 5 percent of the county or state population being served is an LEP language population. The Authority will evaluate LEP needs at a finer population scale for local

and regional events to adhere to or exceed LEP guidelines as is sufficient to meet local language needs. Specific HSR summary documents and fact sheets for the project extent have been translated into Spanish, Vietnamese, and Chinese. To the extent that these documents are current with project advancements, they will continue to be made available to and advertised to low-income and minority populations. The Authority will develop and translate additional materials as deemed important to outreach efforts.

At the conclusion of each public meeting, meeting notes summarizing public comments and feedback will be prepared for use in further refining project details. The Authority will also develop and maintain a calendar of public outreach meetings and document meeting happenings by producing public meeting summaries that concisely capture key take-away messages from both the Authority and the environmental justice stakeholders in attendance

3.3.2 Environmental Justice Group Events and Meetings

In addition to coordinating Authority-hosted public meetings, the Authority will identify on-the-ground outreach opportunities through which they will increase their communication and engagement with low-income and minority populations in the RSA. These outreach opportunities will be coordinated with project milestones to share and gather timely and relevant information. The Authority will develop and maintain a calendar of potential environmental justice events and update the calendar periodically with upcoming events. The Authority will send advance notification of outreach events to environmental justice advocacy and community groups to allow environmental justice stakeholders to schedule accordingly. An HSR outreach representative will attend each of the approved identified events to share with and receive relevant information from the target environmental justice audience using the most relevant outreach strategy for the identified event (e.g., tabling at public events, presenting to local organizations, speaking on a webinar). The Authority will provide information about the process in a format that environmental justice organizations and elected officials representing low-income and minority populations can easily distribute to their constituents, such as in-language constituent newsletters and community news items.

In addition to public outreach, the Authority will coordinate with cultural resources specialists to ensure that historical resources that might be associated with well-established ethnic or other groups are identified. Such properties have the potential to be eligible for the National Register of Historic Places as traditional cultural properties. These properties can be defined generally as those that are eligible for inclusion in the National Register of Historic Places because they are associated with cultural practices or beliefs of a living community that are rooted in that community's history, and are important in maintaining the continuing cultural identity of the community. "Traditional" in this context refers to those beliefs, customs, and practices of a living community of people that have been passed down through the generations, usually orally or through practice. The traditional cultural significance of a historic property, then, is significance derived from the role the property plays in a community's historically rooted beliefs, customs, and practices. The following examples of properties are those that possess such significance:

- A location associated with the traditional beliefs of a Native American group about its origins, its cultural history, or the nature of the world.
- A rural community whose organization, buildings and structures, or patterns of land use reflect the cultural traditions valued by its long-term residents.
- An urban neighborhood that is the traditional home of a particular cultural group, and that reflects its beliefs and practices.
- A location where Native American religious practitioners have historically gone, and are known or thought to go today, to perform ceremonial activities in accordance with traditional cultural rules of practice.
- A location where a community has traditionally carried out economic, artistic, or other cultural practices important in maintaining its historic identity.

3.3.3 Digital Engagement

The Authority will develop ways for environmental justice stakeholders to learn about the project and provide input via smartphones and other mobile devices. For example, using mobile polling at community

events and public meetings or providing project information accessible via smartphones. The Authority will identify digital engagement opportunities that allow busy people to engage outside of work hours, do not require travel, and require an hour or less of participation. The Authority will use social media and digital outreach to provide information about broader engagement opportunities. All potential digital engagement approaches will be vetted by environmental justice advocacy and community groups to confirm each approaches potential for effective engagement and to leverage increased participation.

3.3.4 Environmental Justice Organizations and Community Working Group Engagement

The Authority will conduct quarterly community working group meetings in San Jose, Morgan Hill, Gilroy, and Los Banos over the course of the environmental review as a key venue for collaborative problem-solving and as a way to inform and shape the environmental review. Community working groups provide feedback from local communities and elected officials, insight on a wide variety of key considerations related to the environmental review, best methods to reach and engage constituency groups, and perceptions and feedback received from broader constituencies. The Authority will identify two to three environmental justice organizations to participate in each community working group. In addition, the Authority will conduct periodic check-ins with environmental justice groups to seek advice and input on the outreach effort. These environmental justice groups will be selected based on each groups' history of engagement with affected environmental justice populations and interest and willingness to communicate with the Authority. If there is greater interest on the part of the environmental justice organizations than there is capacity to communicate with each consistently, the Authority will narrow selected environmental justice partners based on maximum outreach potential.

3.3.5 Deliverables

The implementation of the outreach strategy and outreach activities detailed previously will lead to the following deliverables that will inform, among other items, project refinements, environmental mitigation plans, and future outreach activities:

- **Environmental justice database**: a database tool that records organizational contacts and tracks outreach efforts over time, including participation of environmental justice organizations, elected officials and stakeholders in community working group meetings, open houses, environmental milestone meetings and other venues and forums.
- **Environmental justice outreach implementation plan**: a detailed plan for environmental justice outreach implementation that specifies outreach strategies and techniques for each targeted environmental justice population, outreach objectives and tracking metrics, level of effort by project milestone, and outreach documentation.
- **External outreach meeting schedule**: a calendar of external outreach meetings or events at which an Authority representative will be present; this schedule will be reviewed and approved by Authority staff prior to implementation.
- **Internal outreach meeting schedule**: a calendar of outreach meetings or events hosted by the Authority.
- **Meeting agendas and notes**: draft agendas, internal and public meeting summaries, and feedback documentation for all environmental justice outreach-related internal and external meetings.
- **Meeting materials**: invitations, notices, signage, handouts, displays, staffing guides, and other relevant meeting/event materials; translated meeting materials will be provided for LEP populations in accordance with LEP regulation.
- **Digital content:** draft language for key environmental justice outreach and engagement efforts (e.g., social media pushes, mobile polls, website updates)

Attachment 1: Advocacy and Community Groups Serving Low-income and minority Populations

The following list of organizations serve minority and/or low-income communities in the resource study area. This list will be periodically updated to reflect organizational changes or additions.

Organization Name	Description	Geography	Point of Contact	Address	Email	Phone
Acacia Mobile Home Park	Mobile home park	Morgan Hill		18055 Monterey Rd, Morgan Hill, CA 95037		(408) 778-0177
Adams Broadwell Joseph & Cardozo (Attorneys)	Law Firm working on behalf of the labor movement to give a voice to workers and their families in their struggle to secure safe and sustainable jobs and communities	Sacramento	Daniel L. Cardozo	520 Capitol Mall # 350, Sacramento, CA 95814	dcardozo@adamsbroadwell.com	(916) 444-6201
Almaden Seniors Association	501 (C)(3) non-profit corporation that supports the City of San Jose Senior Program	San Jose, CA	Dominique Pacolba	6445 Camden Ave	dominique.pacolba@sanjoseca.gov	(408) 268-1133
Breathe California	Lung health organization that works in the Bay Area to fight lung disease in all its forms and works with its communities to promote lung health	Bay Area, San Benito County, Merced County	Ramya Chitatoor	1469 Park Ave. San Jose, CA 95126	ramya@lungsrus.org	(408) 998-5865
San Jose District 6 Leadership Group	Self-directed group of independent nonpartisan neighborhood association, neighborhood business, school and community leaders group organized to improve communication, research issues, that make recommendations and hold educational meetings to improve the District 6 community and San Jose	San Jose, CA				
Gavilan College	Local community college and administrator of the Gavilan Joint Community College District with campuses in Gilroy and Coyote Creek	Gilroy, CA	Jan Bernstein Chargrin	5055 Santa Teresa Boulevard Gilroy, CA 95020	jbchargin@gavilan.edu	(408) 848-4724

Organization Name	Description	Geography	Point of Contact	Address	Email	Phone
Gilroy Economic Development Corporation	501 (C) (3) non-profit corporation that offers a business assistance model for site selection services, rich data, workforce support and training, and assistance on permitting and development processes	Gilroy, CA	Tammy Brownlow	7471 Monterey Street, Gilroy, CA 95020	president@gilroyedc.org	(408) 847-7611
Gilroy Growing Smarter	Coalition of Gilroy residents who promote good stewardship of Gilroy and its land resources	Gilroy, CA	Connie Rogers	7690 Santa Theresa Drive, Gilroy, CA 95020		
Grassland Environmental Educational Center	Center that depicts the many significant contributions that wildlife managers, the agricultural community, sportsmen and environmentalists make in conserving San Joaquin Valley wetland and farmland resources	Los Banos, CA	Candace Sigmond	18110 Henry Miller Ave, Los Banos, CA 93635		(209) 704-4772
Lenders of Community Development (LCD) of San Jose	Development organization that assists families in becoming homeowners, offers small business loans to low-income individuals, finances the construction of affordable housing, and provides loans for community facilities	San Jose, CA		111 W. St. John Street, Suite 800, San Jose, CA	info@opportunityfund.org	(408) 297-0204
Madera County Economic Development Commission	Commission that assists with business recruitment, expansion and retention with a particular focus on new job creation	Madera County, CA	Bobby Kahn	2425 West Cleveland Avenue, Suite 101, Madera, CA	bkahn@maderacountyedc.com	(559) 675-7768
Oak Grove School District	School district serving southern Santa Clara County	Southern Santa Clara County, CA	Laura Phan	6578 Santa Teresa Blvd. San Jose, CA 95119-1204	business_support_services@ogsd.net	(408) 227-8300, ext. 100216
San Jose Downtown Residents Association	Residents association representing a diverse socio-economic group of residents in the downtown San Jose core that promotes partnerships with the city government and neighborhood businesses	San Jose, CA	Steve Barkley	PO Box 90264, San Jose, CA 95113-9998	info@sjpeople.org

APPENDIX 5-B, ATTACHMENT B: LIST OF OUTREACH MEETINGS HELD FOR THE PROJECT

PUBLIC AND AGENCY MEETINGS

Since publication of the Draft Environmental Impact Report (EIR)/Environmental Impact Statement (EIS), the following substantive changes have been made to this attachment:

- This attachment was updated to include information on engagement concerning community improvements and other engagement following the public circulation of the Draft EIR/EIS and to include meetings with Grasslands Ecological Area stakeholders that had been omitted in error.

The Authority and FRA participated in meetings with the public and with representatives of federal, state, regional, and local agencies throughout the environmental review process. These meetings, which have occurred since 2008, are summarized in Table 1.

Table 1 Public and Agency Meetings

4/26/2017	City of San Jose Staff Working Group	Alignment options, including scheduling a meeting focused on tunnel option, potential cross-overs from Monterey Road to US 101 (at Blossom Hill and SR-85), HSR outreach process
4/26/2017	Santa Clara County staff	Engineering design and alignment options through Santa Clara County
4/27/2017	Caltrans District 4	Meeting to identify the Caltrans Environmental Oversight team and receive early assessment of Caltrans comments and early information related to environmental review
4/28/2017	TransportCA at Mineta Transportation Institute	Authority staff participated in panel discussing Transportation and Triple Bottom Line at Mineta Transportation institute
5/1/2017	Morgan Hill Open House, Morgan Hill Community and Cultural Center	Updates on project, range of alternatives, status of environmental clearance, environmental issues under study, roll-out maps of alignments, opportunities to ask questions and provide written or verbal comments
5/2/2017	NMFS	Fish and Aquatic Resources Working Group meeting #1: Project status to date, project schedule, informal consultation process, review of draft steelhead model
5/3/2017	City of San Jose staff	Public outreach
5/5/2017	CDFW Region 3, CDFW Region 4, CDFW HCP Branch, USFWS	Species Working Group meeting #6: species impact analysis approach, Wildlife Corridor Assessment Focal Species Selection memo
5/8/2017	San Jose City Council	Diridon Station tunnel alternatives
5/9/2017	NorCal FRA Check-In	Status of project definition, agency coordination, 90-day lookahead for San Francisco to San Jose and San Jose to Merced Project Sections
5/10/2017	City of San Jose staff	Public outreach
5/10/2017	City of San Jose Staff Working Group	Cost estimate for Monterey Road, including viaduct, cut/cover, and bored tunnel options
5/11/2017	Caltrans District 10 and California Highway Patrol	Weigh station along I-5, impacts of noise and vibration on the scales
5/11/2017	Central Valley Mitigation Stakeholders, including Grasslands Water District	Presentation of alignment alternatives, regional habitat conservation priorities, and mitigation
5/17/2017	City of San Jose staff	Public outreach
5/22/2017	UC Berkeley Symposium	Update on the statewide program
5/23/2017	NorCal FRA Check-In	Status of project definition, agency coordination, and schedule

Date	Organization/Individual	Topic
5/24/2017	City of Gilroy staff	PEPD Station design including Downtown Gilroy Station and East Gilroy Station
5/24/2017	City of San Jose staff	Public outreach
5/24/2017	Morgan Hill City Council meeting	Updates on statewide program, range of alternatives for Morgan Hill to Gilroy Subsection, Q&A
5/24/2017	NorCal FRA/Resource Agency Coordination	Update on technical deliverables
5/24/2017	SCVWD	Irrigation access workshop focused on SCVWD facilities, primarily conduits/pipelines extending from Pacheco Pass to San Jose and pipeline failures
5/25/2017	VTA/BART	Phase II coordination, including project updates and Newhall Yard area
5/31/2017	City of San Jose staff	Public outreach
5/31/2017	San Jose CWG	Range of alternatives, environmental review process, input from CWG members on topic areas where more information is needed and areas for improved communications
5/31/2017	SLDMWA, San Benito County Water District, CCID, Henry Miller Reclamation District	Irrigation access workshop: SLDMWA, CCID, and Henry Miller Reclamation District facilities along Henry Miller Road and SBCWD interface at Casa de Fruta
6/1/2017	Diridon Intermodal Working Group	Station access memoranda
6/7/2017	City of San Jose staff	Public outreach
6/13/2017	NorCal FRA Check-In	Status of project definition, agency coordination, 90-day look-ahead for San Francisco to San Jose and San Jose to Merced project sections, coordination on process for sharing preliminary 4(f) results for San Jose to Merced Project Section
6/14/2017	City of San Jose staff	Public outreach
6/14/2017	City of San Jose Staff Working Group	Communication protocols, Monterey Corridor cost estimate and alternatives, Diridon At-Grade—East Expansion Exhibit, PEPD, and Hedding St. bridge
6/14/2017	Central Valley Mitigation Stakeholders, including USFWS, Defenders of Wildlife, Audubon Society, The Nature Conservancy, Ducks Unlimited, Grasslands Water District, California Waterfowl, USDA, and Environmental Defense Fund	Regional conservation efforts and mitigation priorities
6/15/2017	NMFS	Fish and Aquatic Resources Working Group meeting #2: Meeting schedule, Steelhead and Chinook Salmon Habitat Suitability memo, steelhead species model
6/15/2017	SAP Center	Project update, Diridon Station development opportunities, impacts on SAP Center parking

Date	Organization/Individual	Topic
6/20/2017	FRA and USDOT	Tour of alignment and discussion of HSR history and outreach
6/21/2017	Central Valley Mitigation Stakeholders, including USFWS, Defenders of Wildlife, Audubon Society, The Nature Conservancy, Ducks Unlimited, Grasslands Water District, California Waterfowl, USDA, Point Blue, and Environmental Defense Fund	Avian protection measures
6/21/2017	City of San Jose staff	Public outreach
6/21/2017	Megaregional Rail Leadership Workshop hosted by Capitol Corridor JPA	Project update, milestones and next steps
6/22/2017	VTA and City of San Jose	VTA needs for running bus service and roadway options along Monterey Road, City of San Jose shared the 100-ft boulevard concept
6/22/2017	VTA/BART	Phase II coordination, including project updates on proposed staging and alternative concepts, and VTA on Newhall Yard area
6/24/2017	Morgan Hill City Council Meeting	Alignment alternatives, community impacts, ROW compensation
6/27/2017	NorCal FRA Check-In	Status of project definition, agency coordination, and 90-day look-ahead for San Francisco to San Jose and San Jose to Merced project sections, review agenda and presentation for next monthly resource agency coordination meeting
6/27/2017	SPUR: How Should High-Speed Rail Travel Through San Jose	Alignments through San Jose and Diridon station
6/28/2017	City of San Jose Staff Working Group	City's request for 100-ft Monterey Road cross section, anticipated ROW requirements for at-grade and aerial alternatives, status of HSR traffic analysis, City comments on the PEPD of City facilities
6/28/2017	NorCal FRA/Resource Agency Coordination	Update on technical deliverables, wildlife crossing overview
6/30/2017	Pacific Gas & Electric	Traction power
6/30/2017	San Jose Councilmember Jimenez	Tunnel and aerial alignments and underground stations
7/7/2017	City of San Jose staff	Public outreach
7/10/2017	City of Gilroy	Conceptual alignments adjacent to US 101
7/11/2017	Morgan Hill Unified School District—teleconference/webinar	Alignment options and impacts on Morgan Hill schools: Enical School, Ann Sobrato High, Barrett Elementary School, and San Martin/Gwinn Elementary School
7/12/2017	City of San Jose staff	Public outreach

Date	Organization/Individual	Topic
7/12/2017	San Jose CWG	Project Section updates, environmental process and evaluation criteria, range of alternatives for Monterey Corridor subsection
7/15/2017	CDFW Region 3, CDFW Region 4, CDFW HCP Branch, USFWS	Species Working Group meeting #7: Project footprint and wildlife corridor analysis
7/19/2017	City of San Jose staff	Public outreach
7/19/2017	Gilroy Community & Neighborhood Revitalization Committee	Updates on Statewide Program, environmental process and evaluation criteria, range of alternatives for Monterey Corridor subsection, future meeting dates and topics, Q&A
7/20/2017	San Martin Neighborhood Alliance	Updates on Project Section, range of alternatives for Morgan Hill to Gilroy subsection, responses to questions submitted to Authority prior to meeting
7/25/2017	NorCal FRA Check-In	Status of project definition, agency coordination, 90-day lookahead for San Francisco to San Jose and San Jose to Merced Project Sections, San Jose to Merced Checkpoint B Addendum process, environmental review process, alternatives refinement, and station planning
7/26/2017	City of San Jose staff	Public outreach
7/27/2017	Caltrans District 4	Traffic impacts along Monterey Road, design exceptions at I-280/SR 87
7/28/2017	SPUR: Urban Innovation Council—Silicon Valley	San Jose State University's expanding campus
8/1/2017	Senator Jim Beall	Central Valley construction tour
8/2/2017	City of Gilroy staff	US 101 alignments
8/2/2017	City of Morgan Hill staff	Reviewed Project Schedule and Draft PEPD plans
8/2/2017	City of San Jose staff	Public outreach
8/2/2017	San Jose CWG	Project Section updates, range of alternatives for the San Jose downtown/Diridon subsection, and review of Hwy 101 alignment elimination
8/2/2017	SPUR Study Tour	Diridon station tour, project integration
8/7/2017	NMFS	Fish and Aquatic Resources Working Group meeting #3: Effects matrix for steelhead, sprint-run Chinook salmon, fall-run Chinook salmon, essential fish habitat
8/8/2017	NorCal FRA Check-In	San Jose to Merced Checkpoint B Addendum comment backcheck, environmental review process, alternatives refinement, station planning
8/9/2017	CCID and Henry Miller Reclamation District	Irrigation access workshop with an overview of design updates in consideration of maintenance access for Henry Miller Reclamation District and CCID facilities
8/9/2017	City of San Jose staff	Public outreach
8/9/2017	City of San Jose Staff Working Group	City generated at-grade alignment concept

Date	Organization/Individual	Topic
8/10/2017	Caltrans District 10	I-5 weigh station and Caltrans initiation of the Draft PEPD
8/16/2017	CDFW Region 3, CDFW Region 4, CDFW HCP Branch, USFWS	Species Working Group meeting #8: Short project description, BA outline, wildlife corridor analysis
8/16/2017	City of San Jose staff	Public outreach
8/22/2017	NorCal FRA Check-In	Status of project definition, agency coordination, and 90-day lookahead for FJ and JM project sections, JM Checkpoint B Addendum Workshop logistics, Environmental review process, alternatives refinement, and station planning
8/23/2017	City of San Jose staff	Public outreach
8/23/2017	NorCal FRA/Resource Agency coordination: CDFW, SGC, STB, USACE, Reclamation, and USEPA	Update on technical report deliverables, NEPA assignment status
8/29/2017	NMFS	Fish and Aquatic Resources Working Group meeting #4: Short project description, BA outline, preliminary compensatory mitigation plan outline, effects matrix for steelhead
8/29/2017	Santa Clara County Board of Supervisors	Approach to Diridon Station, project updates, schedule
8/30/2017	City of Gilroy staff	Alignment alternatives, including US 101
8/30/2017	City of San Jose staff	Public outreach
8/30/2017	Grasslands Water District	Project Section updates, discussion of Draft PEPD in relation to district facilities
8/30/2017	San Jose CWG	Permission-to-enter and ROB processes, construction mitigation, noise impacts, next steps
9/6/2017	City of San Jose staff	Public outreach
9/6/2017	City of San Jose Staff Working Group	Details of City-generated at-grade alignment concept
9/7/2017	Caltrans District 4	Draft PEPD and tunnel construction assumptions
9/8/2017	Caltrain/VTA coordination meeting	Newhall Yard, review of VTA-owned stations, environmental review process, alternatives refinement, station planning
9/9/2017	United Neighborhoods of Santa Clara County Neighborhood Development Conference	San Jose to Merced Project Section and statewide updates
9/11/2017	Senter Monterey Neighborhood Association	Noise, commute, houses, and other impacts along Monterey Road
9/11/2017	Silicon Valley Chamber Coalition	Small business program update
9/12/2017	NorCal FRA Check-In	Status of project definition, agency coordination, 90-day lookahead for San Francisco to San Jose and San Jose to Merced, San Jose to Merced wildlife corridor crossing study
9/14/2017	Caltrans District 10	Section report, project coordination

Date	Organization/Individual	Topic
9/18/2017	Gardner Neighborhood Association	Statewide program overview, Project Section update, review of San Jose Diridon approach alternatives, review of community input, Q&A
9/20/2017	City of San Jose staff	Public outreach
9/20/2017	City of San Jose Staff Working Group	City-generated at-grade alignment concept
9/25/2017	Caltrain, VTA, City of San Jose	Downtown Intermodal Rail Station engineering, design, outreach, legislation
9/26/2017	NorCal FRA Check-In	Project update, outreach update
9/27/2017	City of San Jose staff	Public outreach
9/27/2017	NorCal FRA/Resource Agency Coordination	Agency participation, Project Section status, results of wildlife crossing studies
9/27/2017	San Jose CWG	Overview of and mitigation measures for noise impacts and path of sounds, potential discussion topics for remaining 2017 CWG meetings
9/28/2017	Grasslands Water District	Geographic Information Systems/mapping data
9/28/2017	Station Cities meeting: SPUR, Integral Group	Station area grant review and project update
10/4/2017	City of San Jose staff	Public outreach
10/4/2017	City of San Jose Staff Working Group	City-generated at-grade alignment concept
10/4/2017	SLDMWA	Site tour to review project interface with district facilities
10/10/2017	NorCal FRA Check-In	Project update, outreach update
10/11/2017	City of San Jose staff	Public outreach
10/12/2017	Morgan Hill Unified School District	Project Section update
10/18/2017	City of San Jose staff	Public outreach
10/19/2017	Caltrans District 10	I-5 weigh station
10/24/2017	NorCal FRA Check-In	Project update, outreach update
10/26/2017	Caltrans District 4	?
10/26/2017	City of San Jose staff	Public outreach
10/26/2017	San Jose CWG	Flyover and visual simulations of HSR through San Jose, future meeting schedule and topics
11/1/2017	City of San Jose	Meeting with City of San Jose staff to discuss public outreach
11/1/2017	City of San Jose Staff Working Group	Responses to HSR comments regarding City-generated at-grade alignment concept
11/7/2017	NorCal FRA Check-In	Environmental Review process, alternatives refinement, station planning
11/9/2017	Caltrans District 10	Project update, impacts on I-5 weigh station and temporary access to SR 152
11/15/2017	Morgan Hill City Council Workshop	Project update, outreach update, impacts on Morgan Hill

Date	Organization/Individual	Topic
12/5/2017	NorCal FRA Check-In	Environmental Review process, alternatives refinement, station planning
12/6/2017	City of San Jose staff	Public outreach
12/6/2017	Gilroy City Council Meeting	Project update, outreach update, impacts to City of Gilroy
12/13/2017	City of San Jose	Meeting with City of San Jose staff to discuss public outreach
12/13/2017	Grasslands Water District	Geographic Information Systems/mapping data
12/14/2017	Caltrans District 10	Project update, impacts on I-5 weigh station and temporary access to SR 152
12/19/2017	NorCal FRA Check-In	Environmental Review process, alternatives refinement, station planning
1/4/2018	SCVWD	Responses to SCVWD comments for Draft Floodplain Technical Analysis and Modeling, Llagas Creek, revisions to available hydrologic and hydraulic data, coordination with floodplain managers
1/9/2018	NorCal FRA Check-In	San Francisco to San Jose and San Jose to Merced project definition, agency coordination, workflow discussion including EIR/EIS progress, engineering, and outreach updates
1/10/2018	TNC, SCVOSA, SCVHA, Pathways for Wildlife, Peninsula Open Space Trust, and California Strategic Growth Council	Northern Wildlife Movement Continuing Preliminary Design Workshop focused on wildlife movement in the Soap Lake area
1/11/2018	Willow Glen Neighborhood Association	Project section update, range of alternatives in Willow Glen community
1/17/2018	CHP and Caltrans	Santa Nella platform scale
1/24/2018	Los Banos Landowners Meeting: Merced County Farm Bureau, San Luis Canal Company, and CCID	Project update, responding to questions regarding ROW
1/31/2018	City of Morgan Hill staff	City's proposed alignment east of US 101, administrative and contracting topics
2/13/2018	NorCal FRA Check-In	San Francisco to San Jose and San Jose to Merced project definition, agency coordination, workflow discussion including EIR/EIS progress, engineering, and outreach updates
2/13/2018	TNC, SCVOSA, SCVHA, Pathways for Wildlife, Peninsula Open Space Trust, and California Strategic Growth Council	Coyote Valley wildlife crossing webinar
2/14/2018	TNC, SCVOSA, SCVHA, Pathways for Wildlife, Peninsula Open Space Trust, and California Strategic Growth Council	Northern Wildlife Movement Continuing Preliminary Design Workshop focused on wildlife movement in the Soap Lake area
2/21/2018	Grassland Water District	Engineering review

Date	Organization/Individual	Topic
2/22/2018	LPMG	Executive leadership appointments, 2018 Business Plan schedule, state legislative audit, NEPA assignment, San Francisco to San Jose Project Section update, project management funding agreement with Caltrain, environmental review process, alternatives refinement, station planning
2/23/2018	Community Floodplain Administrators Meeting with SCVWD, City of Morgan Hill, Santa Clara County Planning Department, City of Gilroy, City of San Jose	Proposed structures and typical sections; floodplain study sources; overview of floodplain crossings
2/28/2018	NorCal FRA Check-In	San Jose to Merced Checkpoint B Addendum, NEPA assignment update, update on wildlife crossing studies, San Jose to Merced geotechnical investigations
2/28/2018	TNC, SCVOSA, SCVHA, Pathways for Wildlife, Peninsula Open Space Trust, and California Strategic Growth Council	Workshop on the initial draft of mitigation measures for wildlife crossings and impacts on habitats and species
3/13/2018	NorCal FRA Check-In	San Francisco to San Jose and San Jose to Merced project definition, agency coordination, workflow discussion including EIR/EIS progress, engineering, and outreach updates
3/14/2018	TNC, SCVOSA, SCVHA, Pathways for Wildlife, Peninsula Open Space Trust, and California Strategic Growth Council	Workshop on the initial draft of mitigation measures for wildlife crossings and impacts on habitats and species
3/15/2018	Romero Ranch Landowners and California Strategic Growth Council	Input on wildlife movement, sensitive habitat, and conserved lands management; ranch input on operations and uses; HSR update on proposed alignment, preliminary design and environmental processes, permission to enter for field reconnaissance
3/23/2018	Grassland Water District	Refined preliminary cost estimates for tunnel guideway beneath Mud Slough, assessment of wildlife impacts, status of property inventory for potential agricultural easement purchases
4/10/2018	NorCal FRA Check-In	San Francisco to San Jose and San Jose to Merced project definition, agency coordination, workflow discussion including EIR/EIS progress, engineering, and outreach updates
4/18/2018	City/County Staff Coordinating Group	Caltrain and HSR business plans
4/18/2018	Morgan Hill City Council	2018 Business Plan
4/19/2018	SPUR	2018 Business Plan
4/24/2018	NorCal FRA Check-In	San Francisco to San Jose and San Jose to Merced project definition, agency coordination, workflow discussion including EIR/EIS progress, engineering, and outreach updates
4/26/2018	City of Gilroy staff	Revised preliminary engineering for HSR within the city, request review and comments to HSR

Date	Organization/Individual	Topic
4/26/2018	LPMG	HSR Draft Business Plan/Caltrain Business Plan, Caltrain Electrification Project, Caltrain Positive Train Control Project, Public Comment
4/26/2018	NFIP Floodplain Administrators and Managers	Latest preliminary design at floodplain and floodway encroachments, preliminary hydraulic model results, next steps for reviews and feedback
4/27/2018	TNC, SCVOSA, SCVHA, Pathways for Wildlife, Peninsula Open Space Trust, and California Strategic Growth Council	Latest preliminary design of HSR wildlife crossing features and request review and comments to HSR
5/1/2018	Northern California CWGs and TWGs	2018 Business Plan
5/2/2018	Caltrans District 2	Latest preliminary design of HSR wildlife crossing features, opportunities for collaboration on wildlife crossing improvements and other complementary mitigation efforts
5/2/2018	San Jose CWG	City-generated option, Caltrain Business Plan, 2018 Business Plan
5/3/2018	San Jose City Councilmember Raul Peralez	Outreach planning for Councilmember Peralez's district, including the Gardner neighborhood
5/8/2018	NorCal FRA Check-In	San Francisco to San Jose and San Jose to Merced project definition, agency coordination, workflow discussion including EIR/EIS progress, engineering, and outreach updates
5/18/2018	Grasslands Ecological Area stakeholders: USFWS, Audubon Society, DWR, Ducks Unlimited, Point Blue, Grassland Water District	Update on 2018 Business Plan, preliminary engineering, wildlife movement and crossings
5/22/2018	Mineta Transportation Institute Seminar: High-Speed Technologies on Railway Systems	2018 Business Plan
5/22/2018	San Jose City Council	2018 Business Plan
5/22/2018	SCVHA	Kick off SCVHA's SR 152 Pacheco Pass Wildlife Permeability and Hazards Study
5/29/2018	Grasslands Ecological Area stakeholders: USFWS, Audubon Society, DWR, Ducks Unlimited, Point Blue, Grassland Water District	Preliminary engineering and wildlife crossing features, issues of concern, recommended topics for analysis, data sharing
6/4/2018	San Jose City Councilmember Peralez's staff	San Jose District 3 public outreach
6/5/2018	Caltrain	Communications and outreach coordination, design review with Caltrain and local elected officials
6/6/2018	SCVHA	Preliminary engineering and wildlife crossing features, issues of concern, recommended topics for analysis, data sharing, approaches and opportunities for collaborating on HSR mitigation and complementary conservation activities

Date	Organization/Individual	Topic
6/8/2018	Gilroy Mayor Roland Valasco, Gilroy City Administrator Gabriel Gonzalez, Gilroy Chamber of Commerce	2018 Business Plan, Overview of ROW process
6/10/2018	Picnic with San Jose City Councilmember Raul Peralez	Information Table
6/12/2018	NorCal FRA Check-In	San Francisco to San Jose and San Jose to Merced project definition, agency coordination, workflow discussion including EIR/EIS progress, engineering, and outreach updates
6/13/2018	TNC, SCVOSA, SCVHA, Pathways for Wildlife, Peninsula Open Space Trust, and California Strategic Growth Council	Results of preliminary design refinements for wildlife crossing features, crossing configuration issues, update on 2018 Business Plan implementation
6/14/2018	Los Paseos Neighborhood Association	City-generated Option, 2018 Business Plan
6/15/2018	City of Morgan Hill	2018 Business Plan
6/20/2018	City/County Staff Coordinating Group	Caltrain electrification, milestones and technical analysis, 2018 Business Plan, Connecting Communities Strategy
6/26/2018	City of Morgan Hill staff	UPRR alternative review and updated
6/26/2018	FRA Northern California check-in	Environmental review process, alternatives refinement, station planning
6/26/2018	Gilroy Chamber of Commerce	Planning for an ROW workshop
6/26/2018	Gilroy Unified School District	Blended service between San Jose and Gilroy, impacts on schools
6/27/2018	Grasslands Ecological Area stakeholders: USFWS, Audubon Society, DWR, Ducks Unlimited, Point Blue, Grassland Water District	Lands for agricultural or open space conservation easements, approaches to evaluate potential noise or vibration impacts on waterfowl, wildlife corridor analysis, methods for evaluating bird movement
6/27/2018	NorCal FRA/Resource Agency Coordination	Agency participation, Project Section status, Business Plan 2018 implementation
6/28/2018	LPMG	Caltrain Business Plan, Electrification Project, HSR updates, public comments, LPMG member comments/requests including a grade separation toolkit
6/28/2018	Morgan Hill Chamber of Commerce	Planning for Morgan Hill Caltrain station, planning an ROW workshop
7/2/2018	Oak Grove Neighborhood Association	City-generated option, 2018 Business Plan
7/5/2018	Caltrain	Communications and outreach coordination, PEPD review, restarting CWG, Caltrain Business Plan
7/10/2018	SCVHA	2018 Business Plan; mitigation measures and collaborative implementation, preliminary results of Pacheco Pass wildlife movement analysis
7/12/2018	City of Morgan Hill	Morgan Hill and UPRR right-of-way coordination
7/17/2018	Caltrans District 10	Preliminary design for HSR features near I-5 and state highways in San Joaquin Valley

Date	Organization/Individual	Topic
7/18/2018	City/County Staff Coordinating Group	Environmental review process, PEPD, alternatives refinement, station planning, Caltrain updates on Business Plan and electrification
7/18/2018	SAP Center	Implications for SAP Center resulting from changes to Diridon, including parking plan/analysis
7/18/2018	SCVWD	Preliminary design of UP alternative, 2018 Business Plan
7/18/2018	TNC, SCVOSA, SCVHA, Pathways for Wildlife, Peninsula Open Space Trust, and California Strategic Growth Council	Results of preliminary design refinements for HSR wildlife crossing features, reconfiguration of the Gilroy maintenance-of-way facility, preliminary design of 2018 Business Plan study alternative
7/19/2018	Santa Clara County	Preliminary design refinements, reconfiguration of the Gilroy maintenance-of-way facility, initial preliminary design of the 2018 Business Plan study alternative
7/20/2018	Caltrans District 4	Impacts on I-5 crossing and weigh station
7/20/2018	City of Gilroy	UPRR alignment
7/20/2018	Morgan Hill Chamber of Commerce	Planning for upcoming Morgan Hill Day events
7/24/2018	Caltrain and VTA	Caltrain Business Plan, DISC, initial preliminary design of 2018 Business Plan study alternative
7/24/2018	NorCal FRA Check-In	Environmental review process, alternatives refinement, station planning
7/24/2018	North Willow Glen Neighborhood leaders	Neighborhood visit with neighborhood leaders
7/26/2018	LPMG	Environmental milestones and review process, alternatives refinement, station planning, upcoming activities and outreach, Caltrain electrification, 2018 Business Plan
7/27/2018	Gardner Neighborhood leaders	Neighborhood visit with neighborhood leaders
8/1/2018	Caltrain and VTA	Communication and outreach coordination, City/County Staff Coordinating Group and LPMG coordination, Caltrain Business Plan Outreach and Activities, PEPD city review, restarting CWG
8/1/2018	San Jose City Councilmembers Davis and Peralez's staff	Planning meeting for August 8, 2018 meeting with Councilmembers
8/2/2018	City of San Jose	City-generated option, planning for upcoming CWG
8/8/2018	Diridon	Review each agency's outreach plans
8/8/2018	San Jose City Councilmembers Davis and Peralez	Outreach to neighborhoods in Councilmembers' districts
8/9/2018	City of San Jose	Review San Jose CWG Meeting presentation
8/10/2018	San Jose Mayor Liccardo	Interface of HSR and DISC planning
8/14/2018	Morgan Hill Day	2018 Business Plan, Range of Alternatives
8/14/2018	NorCal FRA check-in	Environmental review process, alternatives refinement, station planning

Date	Organization/Individual	Topic
8/15/2018	City of Morgan Hill	Design review of Alternatives 1–3 refinement
8/15/2018	City/County Staff Coordinating Group	2018 Sustainability Report, PEPD update, San Jose to Merced Project Section update
8/15/2018	Grasslands Ecological Area stakeholders: USFWS, Audubon Society, DWR, Ducks Unlimited, Point Blue, Grassland Water District	Program and project specific mitigation related to crossing Grasslands Ecological Area
8/16/2018	San Jose CWG	CWG Reaffirmation Process, San Jose to Merced Project Section Update, update on Caltrain Business Plan, integration and collaboration of projects and processes, update on HSR alternatives
8/21/2018	Mineta Transportation Institute	Future of Diridon, DISC, and the Caltrain Business Plan
8/22/2018	TNC, SCVOSA, SCVHA, Pathways for Wildlife, Peninsula Open Space Trust, and California Strategic Growth Council	Accommodation of wildlife movement in Santa Clara Valley
8/23/2018	Caltrain	Communications and outreach coordination
8/23/2018	LPMG	Updates on 2018 Sustainability Report, PEPD process, San Jose to Merced Project Section, and outreach; environmental review process, alternatives refinement, station planning
8/23/2018	SCVWD	Design review meeting
8/24/2018	City of Gilroy	Review of at-grade blended alternative
8/28/2018	NorCal FRA check-in	Environmental review process, alternatives refinement, station planning
8/29/2018	San Jose City Councilmembers Davis and Peralez's staff	San Jose CWG Membership and Reaffirmation process
9/5/2018	Caltrain	Communications and outreach coordination, PEPD city review, restarting CWG, July City/County Staff Coordinating Group topics, Caltrain's Business Plan
9/7/2018	San Jose City Councilmember Sergio Jimenez	At-grade blended alternative
9/11/2018	Mineta Transportation Institute National HSR Leadership Summit	Information table covering statewide program and Project Section updates
9/12/2018	Global Climate Action Summit	Statewide program and Project Section updates
9/12/2018	Mineta Transportation Institute National HSR Leadership Summit	Information table covering statewide program and Project Section updates
9/13/2018	Global Climate Action Summit	Statewide program and Project Section updates

3/11/2020	San Jose CWG	Meeting to share the Draft 2020 Business Plan, the Draft EIR/EIS, and the process for providing public comment
3/25/2020	NorCal FRA/Resource Agency Coordination	Update on technical deliverables and schedule and the summary of agency comments and Authority consideration on the Draft EIR/EIS
4/8/2020	Grasslands Ecological Area stakeholders: USFWS, Audubon Society, Ducks Unlimited, Point Blue, Grassland Water District, CDFW, California Waterfowl Associates	Project briefing, Draft 2020 Business Plan, Prep for Draft EIR/EIS, outreach update
4/8/2020	Santa Clara Valley and Pacheco Pass Stakeholders: San Benito Land Trust, Santa Clara Valley Open Space Authority, Santa Clara County, Santa Clara Valley Habitat Agency	Project briefing, Draft 2020 Business Plan, Prep for Draft EIR/EIS, outreach update
4/8/2020	American Society of Civil Engineers San Jose Branch	Project overview and update
4/15/2020	Monterey Corridor Working Group	Project overview and update
4/16/2020	Franklin-McKinley School District, San Jose	Project overview and introduction to the Draft EIR/EIS and the process for providing public comment
4/17/2020	Gavilan College 1st Annual Economic Symposium	Roundtable discussion on transportation, housing, and education
4/19/2020	Muslim Community Association	Community webinar with project overview and introduction to the Draft EIR/EIS and the process for providing public comment
4/21/2020	Edenvale Great Oaks Plan Implementation Coalition	Community webinar with project overview and introduction to the Draft EIR/EIS and the process for providing public comment
4/22/2020	NorCal FRA/Resource Agency Coordination	Update on technical deliverables and schedule, Draft 2020 Business Plan, stakeholder publication primer for Draft EIR/EIS, and outreach update
4/23/2020	Madre-A-Madre	Community webinar with project overview and introduction to the Draft EIR/EIS and the process for providing public comment

Date	Organization/Individual	Topic
4/24/2020	Congressman Jim Costa	Project briefing, Draft 2020 Business Plan, Prep for Draft EIR/EIS, outreach update
4/28/2020	San Jose Word of Faith Christian Center	Community webinar with project overview and introduction to the Draft EIR/EIS and the process for providing public comment
4/29/2020	City of Morgan Hill Draft EIR/EIS Workshop #1	Draft EIR/EIS Q&A workshop with City staff
4/29/2020	City of Gilroy Draft EIR/EIS Workshop #1	Draft EIR/EIS Q&A workshop with City staff
4/30/2020	DISC Outreach Committee	Diridon Station Concept Plan outreach check-in
4/30/2020	San Jose Councilmember Dev Davis	Project briefing, Draft 2020 Business Plan, Prep for Draft EIR/EIS, outreach update
5/1/2020	City of San Jose Draft EIR/EIS Workshop #1	Draft EIR/EIS Q&A workshop with City staff
5/5/2020	Morgan Hill Unified School District Board	Update on 2020 Business Plan, Morgan Hill alternatives, Draft EIR/EIS
5/6/2020	Silicon Valley Leadership Group	Update on 2020 Business Plan and status of environmental clearance in Northern California
5/7/2020	Streetblog - Talking Headways Recording	Recorded interview to discuss project overview, status, benefits, and the Draft EIR/EIS
5/11/2020	Open House Webinar #1	Webinar providing an opportunity for public to ask questions of technical staff regarding general topics, Draft EIR/EIS, and project alternatives
5/11/2020	Draft EIR/EIS Office Hours	One-on-one call with public to discuss Draft EIR/EIS
5/13/2020	City of Morgan Hill Draft EIR/EIS Workshop #2	Draft EIR/EIS Q&A workshop with City staff
5/14/2020	Open House Webinar #2	Webinar providing an opportunity for public to ask questions of technical staff regarding general topics, Draft EIR/EIS, and project alternatives
5/15/2020	HNTB Mega Project Planning Brown Bag	Discussion on Mega Project planning in times of uncertainty (COVID-19)
5/15/2020	Santa Clara Valley and Pacheco Pass Wildlife Stakeholders: San Benito Land Trust, Santa Clara Valley Open Space Authority, The Nature Conservancy, Santa Clara County, Santa Clara Valley Habitat Agency	Draft EIR/EIS Q&A workshop
5/18/2020	Open House Webinar #3	Webinar providing an opportunity for public to ask questions of technical staff regarding general topics, Draft EIR/EIS, and project alternatives
5/20/2020	City/County Staff Coordinating Group	Presentation on Draft 2020 Business Plan, Draft EIR/EIS, construction update
5/20/2020	Draft EIR/EIS Office Hours	One-on-one call with public to discuss Draft EIR/EIS

Date	Organization/Individual	Topic
5/21/2020	CWG Webinar	Webinar providing an opportunity for CWG members to ask questions of technical staff regarding general topics, Draft EIR/EIS, and project alternatives
5/26/2020	City of San Jose Draft EIR/EIS Workshop #2	Draft EIR/EIS Q&A workshop with City staff
5/27/2020	NorCal FRA/Resource Agency Coordination	Update on technical deliverables and schedule, a public outreach update for the Draft EIR/EIS
5/27/2020	Draft EIR/EIS Public Hearing	Webinar providing an opportunity for verbal public comment
5/27/2020	Draft EIR/EIS Office Hours	One-on-one call with public to discuss Draft EIR/EIS
5/28/2020	LPMG	Northern California Project Section updates, outreach update, Draft EIR/EIS
6/4/2020	City of Gilroy Draft EIR/EIS Workshop #2	Draft EIR/EIS Q&A workshop with City staff
6/10/2020	Mobility Partnership	Update on San Jose to Merced Project Section environmental clearance and Draft EIR/EIS outreach
6/17/2020	City/County Staff Coordinating Group	Update on 2020 Business Plan, San Jose to Merced Project Section Draft EIR/EIS, San Francisco to San Jose Project Section Draft EIR/EIS
6/17/2020	SAAG Meeting	Planning update on Diridon Station Area Plan and Google Downtown West Mixed-Use Plan, updated Civic Engagement Plan, overview of results from Spring 2020 online outreach and survey
6/17/2020	Santa Clara County Refugee and Immigrant Forum	Consultant staff provided a project update to this service provider collaborative (comprised of 10+ environmental justice-focused community based organizations) regarding environmental justice community improvement process and the Draft EIR/EIS process.
6/23/2020	DISC Outreach Sub-Committee	Diridon Station Concept Plan outreach check-in
6/24/2020	NorCal FRA/Resource Agency Coordination	Update on technical deliverables and schedule, summary of agency comments and Authority consideration for the San Francisco to San Jose Project Section Draft EIR/EIS
6/25/2020	LPMG	Northern California Project Section updates: outreach, Draft EIR/EIS, Final Business Plan (December 2020)
7/1/2020	Northern California Legislative Briefing	Statewide program update (2020 Business Plan, COVID-19 impacts, legislative hearings, construction update, track and systems procurement) and NorCal update (downtown rail extension MOU, environmental document preparation process, environmental milestones, San Jose to Merced Project Section Draft EIR/EIS outreach summary, San Francisco to San Jose Project Section lookahead)
7/15/2020	City/County Staff Coordinating Group	Update on 2020 Business Plan, San Francisco to San Jose Project Section Draft EIR/EIS

Date	Organization/Individual	Topic
7/16/2020	Young Professionals in Infrastructure: Future of Rail Event	Discussion of 2020 Business Plan, Northern California environmental work and project development stages, 4000 workers milestone
7/20/2020	Morgan Hill Unified School District	A 1-hour discussion with potential implementing partners to review and refine their community improvement ideas, and evaluation of the ideas
7/22/2020	NorCal FRA/Resource Agency Coordination	Update on technical deliverables, Draft EIR/EIS, and schedule
7/22/2020	City of Morgan Hill	A 1-hour discussion with potential implementing partners to review and refine their community improvement ideas, and evaluation of the ideas
7/23/2020	LPMG	Northern California Project Section updates: San Francisco to San Jose Project Section Draft EIR/EIS navigation, Final Business Plan (December 2020), Meet/Map HSR NorCal walkthrough
7/23/2020	Santa Clara County Parks & Recreation Department	A 1-hour discussion with potential implementing partners to review and refine their community improvement ideas and evaluation of the ideas
7/24/2020	Rebekah Children's Services	A 1-hour discussion with potential implementing partners to review and refine their community improvement ideas and evaluation of the ideas
7/27/2020	San Jose Councilmember Dev Davis	Provided an update on the high-speed rail program
7/27/2020	African American Community Services Agency	A 1-hour discussion with potential implementing partners to review and refine their community improvement ideas and evaluation of the ideas
7/27/2020	Gavilan College	A 1-hour discussion with potential implementing partners to review and refine their community improvement ideas and evaluation of the ideas
7/27/2020	San Jose Downtown Residents Association	Project overview and update
7/28/2020	Bay Area Council Transportation Committee HSR Event	Northern California Project Section updates: Draft EIR/EIS, Final Business Plan (December 2020), COVID-19's impact on project timeline and workforce
7/28/2020	City of Gilroy	A 1-hour discussion with potential implementing partners to review and refine their community improvement ideas and evaluation of the ideas
7/28/2020	City of Santa Clara	A 1-hour discussion with potential implementing partners to review and refine their community improvement ideas and evaluation of the ideas
7/29/2020	Los Banos Unified School District	A 1-hour discussion with potential implementing partners to review and refine their community improvement ideas and evaluation of the ideas
7/29/2020	Gilroy Unified School District	A 1-hour discussion with potential implementing partners to review and refine their community improvement ideas and evaluation of the ideas

Date	Organization/Individual	Topic
7/30/2020	Center for Employment Training (CET)	A 1-hour discussion with potential implementing partners to review and refine their community improvement ideas and evaluation of the ideas
7/30/2020	City of San Jose and San Jose Department of Parks & Recreation	A 1-hour discussion with potential implementing partners to review and refine their community improvement ideas and evaluation of the ideas
7/30/2020	VTA	A 1-hour discussion with potential implementing partners to review and refine their community improvement ideas and evaluation of the ideas
7/31/2020	Transbay Joint Powers Authority	Downtown rail extension U-wall conflict with mainline tracks
7/31/2020	Homeless Service Providers	A 1-hour discussion with potential implementing partners to review and refine their community improvement ideas and evaluation of the ideas
7/31/2020	San Jose Unified School District	A 1-hour discussion with potential implementing partners to review and refine their community improvement ideas and evaluation of the ideas
8/12/2020	San Jose City Councilmember Maya Esparaza	Draft EIR/EIS comment period update, environmental justice update, Monterey Corridor Working Group
8/19/2020	City/County Staff Coordinating Group	Comment period extension, public hearing
8/27/2020	LPMG	Comment period extension, public hearing
8/27/2020	Silicon Valley Leadership Group CEO Ahmad Thomas	Briefing on the high-speed rail program
8/28/2020	California State Assembly Candidate Alex Lee	Briefing on the high-speed rail program
9/2/2020	DISC Technical Working Group	Walk through of rail alignment at San Jose Diridon Station, agency coordination
9/2/2020	CalWORKS Advisory Council	Presentation to share project updates
9/3/2020	Garden Alameda Village Association	Presented on the San Francisco to San Jose Project Section Draft EIR/EIS public review period, and environmental topics as they relate to the community
9/10/2020	Santa Clara Unified School District	Briefing to update the Superintendent on environmental justice improvement process prior to presenting before the Board of Trustees
9/17/2020	Construction Management Association of America NorCal Chapter	Statewide program and Northern California HSR updates
9/22/2020	Hispanic Chamber of Commerce Silicon Valley	Project update and overview of the CWG
9/23/2020	NorCal FRA/Resource Agency Coordination	Update on technical deliverables, Draft EIR/EIS and schedule
9/24/2020	Santa Clara Unified School District Board	Presentation on Northern California project updates and Santa Clara County–specific improvements

Date	Organization/Individual	Topic
9/30/2020	Northern California Legislative Briefing	Statewide program updates, the 2020 Sustainability Report, and updates on the Northern California Region
10/14/2020	NorCal Resource Agency Coordination	Update on technical deliverables, Draft EIR/EIS and schedule, and San Jose to Merced Project Section Revised/Supplemental Draft EIR/EIS limited recirculation overview and schedule
10/14/2020	American Society of Civil Engineers-Golden Gate Branch	Project overview presentation
10/14/2020	Stanford University	Class lecture on key decisions taken over last 30 years with California HSR, challenges, and what comes next
10/20/2020	Congressman Josh Harder	Briefing to share project updates
10/29/2020	San Jose State University Institute of Transportation Engineers	Presentation to students on the program and engineering topics
11/4/2020	SPUR San Jose	Briefing to share project updates
11/5/2020	San Jose City Councilmember Raul Peralez	Briefing to share project updates
11/11/2020	Hispanic Chamber of Commerce Silicon Valley	Project update to the Board
11/18/2020	Northern California Resource Agency	Meeting to discuss technical deliverables and the Cooperating and Responsible Agency Review Kickoff for the San Jose to Merced Project Section Revised/Supplemental Draft EIR/EIS
11/18/2020	City/County Staff Coordinating Group	Presentation on outreach survey and international blended systems
11/18/2020	CWG Webinar	Meeting to share project updates, the 2020 Sustainability Report, the Early Train Operators survey primary research, international examples of blended service operations and the results of the Northern California Outreach Survey
11/19/2020	LPMG	Presentation on outreach survey and international blended systems
12/17/2020	Northern California Legislative Briefing	Presentation on 2020 Business Plan, new administration, construction progress, and end of year review
1/5/2021	VTA	Meeting to discuss VTA's plans to develop a transit-oriented development, the Authority's request to match grant funding for the Station Area Plan, and right-of-way needs
1/13/2021	San Jose Councilmember Sergio Jimenez	Briefing to share project updates
1/20/2021	City/County Staff Coordinating Group	Verbal update provided on project updates
1/22/2021	Briefing with State Senator Dave Cortese	Briefing to share project updates
1/28/2021	LPMG	Verbal update on construction and Draft 2020 Business Plan

Date	Organization/Individual	Topic
1/28/2021	San Jose Councilmember Dev Davis	Project update and overview of the Draft 2020 Business Plan
2/8/2021	Valley Christian High School	Presentation on project and NorCal updates and I Will Ride
2/11/2021	Mineta Transportation Institute Student Association	Presentation on project and NorCal updates and I Will Ride
2/17/2021	City/County Staff Coordinating Group	Verbal update on the Draft 2020 Business Plan update, San Jose to Merced Project Section Revised/Supplemental Draft EIR/EIS recirculation, and Final EIR/EIS and ROD Schedule
2/18/2021	Gilroy City Councilmembers Armendariz and Hilton	Project update and overview of the Draft 2020 Business Plan
2/24/2021	Sierra Club Conservation Committee Presentation	Presentation on sustainability and Envision Award
2/24/2021	NorCal Legislative Briefing	Presentation on the Draft 2020 Business Plan, San Jose to Merced Project Section Revised/Supplemental Draft EIR/EIS, Final EIR/EIS ROD schedule
2/24/2021	California High-Speed Rail Authority NorCal Resource Agency Coordination	Presentation on program updates and briefing on the San Jose to Merced Project Section Revised/Supplemental Draft EIR/EIS
2/24/2021	Gilroy Mayor Blankley and City Administrator Forbis	Project update and overview of the Draft 2020 Business Plan
2/25/2021	LPMG	Verbal update on the Draft 2020 Business Plan, San Jose to Merced Project Section Revised/Supplemental Draft EIR/EIS, Final EIR/EIS ROD schedule
2/25/2021	TWG Webinar	Presentation on the Draft 2020 Business Plan and Funding 101
2/26/2021	JPA Board	Presentation on the Draft 2020 Business Plan
3/1/2021	City of San Jose Transportation and Environment Committee	Presentation on the Draft 2020 Business Plan
3/2/2021	SPUR HSR Lunchtime Forum	Presentation on the Draft 2020 Business Plan
3/3/2021	CWG Webinar	Presentation on the Draft 2020 Business Plan and Funding 101
3/9/2021	San Mateo County Economic Development Association HLUT Committee	Revised Draft 2020 Business Plan
3/10/2021	Mobility Partnership	Presentation on the environmental process and revised Draft 2020 Business Plan
3/17/2021	City/County Staff Coordinating Group	Verbal update provided on project updates
3/24/2021	NorCal Resource Agency Coordination	Presentation on San Francisco to San Jose and San Jose to Merced project section updates

Date	Organization/Individual	Topic
3/25/2021	Independence High School/Engineering Academy	Presentation geared to engineering pathway freshmen at Independence High School on project overview, sustainability, operations, engineering, and careers
3/25/2021	LPMG	Verbal update provided on project updates
4/22/2021	LPMG	Update on Revised/Supplemental Draft EIR/EIS and Business Plan
6/24/2021	LPMG	USDOT agreement and Revised/Supplemental Draft EIR/EIS end
7/22/2021	LPMG	San Francisco to San Jose Project Section EIR/EIS recirculation, Congressional call for dedicated HSR funding, and Burbank to Palmdale Final EIR/EIS
8/26/2021	LPMG	Millbrae meeting brief overview. Comment period update. Photos from tabling. August construction update. Burbank to Palmdale Final EIR/EIS.
9/7/2021	City of Morgan Hill, Implementing Partner Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/8/2021	Los Banos Unified School District, Implementing Partner Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/8/2021	Gilroy Unified School District, Implementing Partner Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/9/2021	City of San Jose, Implementing Partner Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/10/2021	City of Gilroy, Implementing Partner Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/13/2021	Rocketship Schools Meeting, Other Interested Party Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/13/2021	African American Community Services Agency, Other Interested Party Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/13/2021	Guadalupe Washington Community Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/14/2021	City of Santa Clara, Implementing Partner Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/14/2021	Gardner Community Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback

Date	Organization/Individual	Topic
9/15/2021	Santa Clara County Agencies, Interested Parties	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/15/2021	Santa Clara Community Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/16/2021	San Jose Unified School District, Implementing Partner Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/16/2021	Gavilan College, Other Interested Party Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/17/2021	Franklin McKinley School District, Other Interested Party Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/20/2021	San Jose Diridon Community Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/21/2021	Morgan Hill Community Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/22/2021	Los Banos Community Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/22/2021	Santa Clara County Office of Supportive Housing/Homeless services, Implementing Partner Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/23/2021	Sacred Heart, Other Interested Party Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/23/2021	Oak Grove School District, Other Interested Party Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/23/2021	South San Jose Community Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/24/2021	Rebekah Children's Services, Implementing Partner Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/28/2021	Center for Employment Training (CET), Other Interested Party Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback
9/28/2021	Gilroy Community Meeting	Explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback

Date	Organization/Individual	Topic
9/29/2021	Morgan Hill Unified School, Interested Parties Meeting	Provide overview of project, explain/present on updates to environmental justice analysis, mitigations, benefits, and community improvements, gain feedback

APPENDIX 5-B, ATTACHMENT C: BIANNUAL ENVIRONMENTAL JUSTICE OUTREACH REPORTS

SAN JOSE TO MERCED PROJECT SECTION
ENVIRONMENTAL JUSTICE OUTREACH SUMMARY
April 16 – October 15, 2016

Overview

The following report summarizes environmental justice[i] outreach activities conducted for the California High-Speed Rail Authority San Jose to Merced Project Section between April 16 and October 15, 2016. These activities are consistent with the overall approach and specific strategies outlined in the San Jose to Merced Environmental Justice Outreach Plan and the High-Speed Rail Project Environmental Impact Report/Environmental Impact Statement Environmental Methodology Guidelines, Version 5 (or, EMGv5).

Similar to the San Jose to Merced Environmental Justice Outreach Plan, the activities in this report are organized into the following outreach categories:

- Public meetings
- Organizational stakeholder contact
- Stakeholder group meetings
- Local stakeholder contact

I. Public Meetings

During the reporting period, the Authority conducted four public meetings in the San Jose to Merced Project Section, including:

Date	City	Meeting Location
May 16, 2016	Los Banos	Los Banos Community Center
May 17, 2016	San Jose	Berryessa Community Center
May 18, 2016	Gilroy	Gilroy Senior Center
June 6, 2016	San Jose	Gardner Community Center

Each of these cities includes substantial low-income and limited English-proficient (LEP) populations. For each of the public meetings, the Authority provided interpreters for languages commonly spoken (i.e., 5% or more of the population speaks the language as its first language) in each respective community (Spanish for Gilroy and Los Banos; Spanish and Vietnamese for San Jose). The meeting invitation flyer was translated and made available in the following languages: English, Spanish, Mandarin, Vietnamese and Tagalog (note: these are the five most commonly spoken languages in the San Jose to Merced Project Section). In addition, several factsheets were available in Spanish at the meetings.

Title VI[ii] reports were submitted to the Title VI Coordinator within 5 days after each public meeting.

II. Organizational Stakeholder Contact

A series of interviews was conducted in July and August of 2016 with stakeholders serving environmental justice populations along the San Jose to Merced Project Section to inform the Authority's outreach efforts to these populations. The primary objectives of the interviews were to:

- Better understand the interests and concerns of low-income and minority populations and how they relate to the High-Speed Rail project;
- Inform the Authority's strategy for meaningfully engaging low-income and/or minority stakeholders, including anticipating and responding to potential challenges; and
- Identify specific environmental justice outreach opportunities (events, meetings, neighborhood groups, etc.) and additional stakeholders with whom to partner moving forward.

The following stakeholders were interviewed for the San Jose to Merced Project Section:

Organization	Point of Contact
Asian Americans for Community Involvement	Cam Vu and Anne Marie Tran
California Environmental Protection Agency	Arsenio Mataka
City of Gilroy	David Bischoff
City of San Jose District Three	Lucila Ortiz and Heidi Sickler
Delmas Park Neighborhood Association	Andrew Tubbs and Bert Weaver
Greenbelt Alliance	Brian Schmidt
Sierra Health Foundation	Manuel Alvarado
TransForm	Chris Lepe

The following high-level themes emerged from the interviews:

- Building **credibility and trust** within an environmental justice community is essential to effective engagement. This can be accomplished by partnering with local community organizations and thought leaders to share information and co-convene meetings, and demonstrating an understanding of their interests and concerns. Environmental justice communities often have an acute mistrust of government agencies, and while this can be overcome, it will take time and commitment.
- Environmental justice communities have varying degrees of familiarity with the HSR project. To build understanding, project information should be communicated in **simple, non-technical terms and translated in-language**, and graphics and visuals should be used to explain complex topics.
- To ensure constructive interactions with environmental justice stakeholders, the Authority should provide **comfortable, convenient, and culturally relevant opportunities for stakeholder participation**. This approach includes leveraging existing community meetings and gatherings, and engaging residents where they live, shop and play.
- Environmental justice stakeholders often do not attend Authority-convened events because they have **competing, higher-priority needs**. By addressing these needs through providing food and childcare, and holding meetings at times convenient to residents, the Authority can demonstrate it values their time and wants to make the process as convenient as possible.
- When engaging environmental justice communities, the Authority should frame the project more as a **quality of life issue** than exclusively a transportation issue, which will make it more relatable to local needs and priorities. If the Authority can demonstrate that the HSR project can help improve the overall quality of their lives by alleviating current community challenges (e.g.,

poor air quality, traffic congestion, poverty) while providing tangible benefits (e.g., job creation, economic development, improved mobility and accessibility), residents of these communities are more likely to want to participate in the process.

The *Summary of Interviews with Environmental Justice Stakeholders – San Francisco to San Jose and San Jose to Merced Project Sections* report was developed to capture and summarize these interviews.

III. Group Stakeholder Meetings

The Authority convened Community Working Groups (CWGs) in the San Jose to Merced Project Section to discuss and gather input on project alternatives with community members representing a broad range of local interests. Each of the CWGs includes representatives of environmental justice communities in the project section. During the reporting period, the Authority conducted the following CWG meetings:

- April 18, 2016: Los Banos CWG
- August 9, 2016: Gilroy-Los Banos Technical Working Group (note: members of the Los Banos CWG were invites to participate as members of this group)
- August 11, 2016: Morgan Hill-Gilroy CWG
- August 17, 2016: San Jose CWG

Title VI reports were submitted to the Title VI Coordinator for each CWG meeting.

IV. Local Stakeholder Contact

In addition to hosting public meetings and CWG meetings, the Authority and/or regional consultant staff also attended community events in the San Jose to Merced Project Section to provide project information and gather stakeholder input from stakeholders in environmental justice communities, including:

- August 20, 2016: Gardner Community Flea Market (San Jose)
- September 18, 2016: VivaCalle San Jose
- October 9, 2016: Day on the Bay Multicultural Festival (Alviso)

Title VI reports were submitted to the Title VI Coordinator for each outreach event.

In addition, Authority and/or consultant staff participated in the following small group meetings and briefings with representatives of environmental justice communities:

- June 7, 2016: Meeting with San Jose District 6 neighborhood residents
- September 12, 2016: Presentation to Gilroy City Council
- September 13, 2016: Meeting with San Jose District 2 staff and City of San Jose staff to discuss outreach to residents along Monterey Highway corridor

[i] The Authority's definition and application of the term "environmental justice" as it relates to the High Speed Rail project is as follows: *"Environmental Justice (EJ) is the fair treatment of people of all races, cultures, and income with respect to the development, adoption, implementation and enforcement of environmental laws and policies. Implementation of environmental justice principles in how the Authority plans, designs, and delivers the high-speed rail projects means that the Authority recognizes the potential social and environmental impacts that project activities may have on certain segments of the public."* (HSR Authority, Title VI Report, 2013)

[ii] Title VI of the Civil Rights Act of 1964, as amended, states that "no person in the United States shall, on the grounds of race, color, or national origin, be excluded from participation in, be denied the benefit of, or be subjected to discrimination under any program or activity that receives Federal financial assistance" (Civil Rights Act of 1964, Title VI).

SAN JOSE TO MERCED PROJECT SECTION
ENVIRONMENTAL JUSTICE OUTREACH SUMMARY
October 16, 2016 – April 30, 2017

Overview

The following report summarizes environmental justice[i] (Title VI) public involvement activities conducted for the California High-Speed Rail San Jose to Merced Project Section between October 16, 2016 and April 30, 2017. These activities are consistent with the overall approach and specific strategies outlined in the San Jose to Merced Environmental Justice Outreach Plan and the High-Speed Rail Project Environmental Impact Report/Environmental Impact Statement Environmental Methodology Guidelines, Version 5 (or, EMGv5).

Similar to the San Jose to Merced Environmental Justice Outreach Plan, the activities in this report are organized into the following outreach categories:

- Public meetings
- Stakeholder group meetings
- Local stakeholder contact

• Public Meetings

During the reporting period, the Authority conducted three public meetings in the San Jose to Merced Project Section, including:

Date	City	Meeting Location
April 18, 2017	Gilroy	I.F.D.E.S. Lodge-Portuguese Hall
April 20, 2017	San Jose	Southside Community Center
April 25, 2017	Los Banos	Los Banos Community Center

Each of the cities where the public meetings were held includes substantial low-income and limited English-proficient (LEP) populations. For each of the public meetings, the Authority provided interpreters for languages commonly spoken (i.e., 5% or more of the population speaks the language as its first language) in each respective community (Spanish for Gilroy and Los Banos; Spanish and Vietnamese for San Jose). The meeting invitation flyer was translated and made available in the following languages: English, Spanish, Mandarin, Vietnamese and Tagalog. In addition, several factsheets were available in Spanish at the meetings.

Kearns & West developed Title VI[ii] reports for each public meeting and they are available on the California High-Speed Rail project SharePoint site. Title VI reports were submitted to the Title VI Coordinator within 5 days after each public meeting.

- **Group Stakeholder Meetings**

The Authority convened Community Working Groups (CWGs) in the San Jose to Merced Project Section to discuss and gather input on project alternatives with community members representing a broad range of local interests. Each of the CWGs includes representatives of environmental justice communities in the project section. During the reporting period, the Authority conducted the following CWG meetings:

- January 23, 2017: San Jose CWG (Edenvale Public Library)
- January 26, 2017: Morgan Hill-Gilroy CWG (I.F.D.E.S. Lodge-Portuguese Hall in Gilroy)

Kearns & West developed Title VI reports for each CWG meeting and they are available on the California High-Speed Rail project SharePoint site.

- **Local Stakeholder Contact**

In addition to hosting public meetings and CWG meetings, the Authority and/or regional consultant staff also hosted information tables at community gathering locations in the San Jose to Merced Project Section to provide project information and gather stakeholder input from stakeholders in environmental justice communities, including:

- November 29, 2016: Edenvale Public Library (San Jose)
- December 19, 2016: Gilroy Downtown Library
- April 6, 2017: Gilroy Downtown Library
- April 17, 2017: Arteaga's Market (Gilroy)

In addition, Authority and/or consultant staff participated in the following small group meetings and briefings with representatives of environmental justice communities:

- October 27, 2016: Meeting with San Jose residents at the Edenvale Public Library. The meeting was hosted by San Jose District 2 City Councilmember Ash Kalra.
- November 14, 2016: Meeting with Gilroy neighborhood representatives to discuss outreach to residents of environmental justice communities in Gilroy.
- December 7, 2016: Meeting with Edenvale Great Oaks Plan Implementation Coalition (EGOPIC) at the Edenvale Community Center in San Jose.
- February 1, 2017: Meeting with the Seven Trees Neighborhood Association at the Seven Trees Community Center in San Jose.
- February 13, 2017. Meeting with the Gardner Neighborhood Association at the Gardner Community Center in San Jose.
- March 8, 2017: Meeting with the Goodyear-Mastic and Alma Neighborhood Associations at the Alma Senior Center in San Jose.

Kearns & West developed Title VI reports for each local stakeholder outreach event and they are available on the project SharePoint site.

The following items emerged from the environmental justice outreach events:

- Questions and concern about impacts to property value and how compensation would occur

- Questions and concerns about noise impacts from train operation and construction
- Concerns about traffic impacts from train operation and construction
- Concerns about increased graffiti on aerial structures and sound walls
- Concern about urbanization in East Gilroy
- Questions and concerns about the reliability of funding for High-Speed Rail
- Concern about amount of right of way available along Monterey Corridor
- Questions about the timeline for construction
- Questions about the choice of station locations
- Questions about the cost of tickets and speed of trains

[i] The Authority's definition and application of the term "environmental justice" as it relates to the High Speed Rail project is as follows: *"Environmental Justice (EJ) is the fair treatment of people of all races, cultures, and income with respect to the development, adoption, implementation and enforcement of environmental laws and policies. Implementation of environmental justice principles in how the Authority plans, designs, and delivers the high-speed rail projects means that the Authority recognizes the potential social and environmental impacts that project activities may have on certain segments of the public."* (HSR Authority, Title VI Report, 2013)

[ii] Title VI of the Civil Rights Act of 1964, as amended, states that "no person in the United States shall, on the grounds of race, color, or national origin, be excluded from participation in, be denied the benefit of, or be subjected to discrimination under any program or activity that receives Federal financial assistance" (Civil Rights Act of 1964, Title VI).

SAN JOSE TO MERCED PROJECT SECTION
ENVIRONMENTAL JUSTICE OUTREACH SUMMARY
May 1, 2018 – October 31, 2018

Overview

The following report summarizes environmental justice[i] outreach activities conducted for the California High-Speed Rail Authority San Jose to Merced Project Section between May 1, 2018 and October 31, 2018. These activities are consistent with the overall approach and specific strategies outlined in the San Jose to Merced Environmental Justice Outreach Plan and the High-Speed Rail Project Environmental Impact Report/Environmental Impact Statement Environmental Methodology Guidelines, Version 5 (or, EMGv5).

Similar to the San Jose to Merced Environmental Justice Outreach Plan, the activities in this report are organized into the following outreach categories:

- Public meetings
- Stakeholder group meetings
- Local stakeholder contact

I. Public Meetings

During the reporting period, there were no Authority-hosted public meetings in the San Jose to Merced Project Section.

II. Group Stakeholder Meetings

The Authority convened three meetings with Community Working Groups (CWGs) across the San Jose to Merced project section to discuss and gather input on the 2018 Business Plan and project alternatives with community members representing a broad range of local interests. Each of the CWGs includes representatives of environmental justice communities in the project section. During the reporting period, the Authority conducted the following CWG meeting:

- May 1: Business Plan Webinar with NorCal Community Working Groups
- May 2: San Jose CWG
- August 16: San Jose CWG

The following items emerged from the CWG meetings:

- Concern regarding impacts to existing infrastructure (e.g., Diridon Station, Monterey Highway, historic structures).
- Questions about the feasibility of tunneling and aerial approaches.
- Questions about the process/rationale for selecting a preferred alternative and which crossings will have grade separations.
- Concern regarding noise, vibration, aesthetic and pollution impacts and potential mitigations during construction and operation.
- Concern about connections to local transit.

- Concern that blended service will result in slower trains, longer travel times and increased traffic congestion.
- Concern regarding the increase in the number of trains and people in the Diridon station area.
- Concern that the community lacks awareness of the project.
- Concern about lack of coordination with other agencies and external planning efforts.

III. Local Stakeholder Contact

During the reporting period, the San Jose to Merced Project Section's outreach consultant participated in eight local outreach events, conducted zero neighborhood canvasses and two stakeholder/service provider interviews.

Outreach Events

- June 8: Gilroy Right-of-Way Workshop
- July 2: Oak Grove Neighborhood Association Meeting
- August 14: Morgan Hill Morning Community Meeting
- August 14: Morgan Hill Evening Community Meeting
- September 20: Gilroy Small Business Workshop
- September 24: Gilroy Unified School District and City Council Meeting
- October 18: San Martin Neighborhood Alliance Meeting
- October 23: Delmas Park Neighborhood Association Meeting

Stakeholder/Service Provider Interviews

- October 29: Beatriz Sanchez (Biblioteca Latinoamericana, San Jose)
- October 31: Ky Le (Santa Clara County Office of Supportive Housing, Santa Clara County)

The following items emerged from the environmental justice outreach activities:

- Concern about impacts to local businesses during construction.
- Concern about property acquisition and receiving fair compensation.
- Concern about noise, vibration and visual impacts.
- Concern that more train crossings will increase traffic congestion and reduce parking availability.
- Concern about the project's viability in terms of whether there is sufficient funding to see it through.
- Concern regarding coordination with other projects.
- Questions about relative cost of various alternatives.
- Concern regarding safety at crossings.

[i] The Authority's definition and application of the term "environmental justice" as it relates to the High Speed Rail project is as follows: *"Environmental Justice (EJ) is the fair treatment of people of all races, cultures, and income with respect to the development, adoption, implementation and enforcement of environmental laws and policies. Implementation of environmental justice principles in how the Authority plans, designs, and delivers the high-speed rail projects means that the Authority recognizes the potential social and environmental impacts that project activities may have on certain segments of the public."* (HSR Authority, Title VI Report, 2013)

SAN JOSE TO MERCED PROJECT SECTION
ENVIRONMENTAL JUSTICE OUTREACH SUMMARY
November 1, 2018 – April 30, 2019

Overview

The following report summarizes environmental justice[i] outreach activities conducted for the California High-Speed Rail Authority (Authority) San Jose to Merced Project Section between November 1, 2018 and April 30, 2019. These activities are consistent with the overall approach and specific strategies outlined in the San Jose to Merced Environmental Justice Outreach Plan and the High-Speed Rail Project Environmental Impact Report/Environmental Impact Statement Environmental Methodology Guidelines, Version 5 (or, EMGv5).

In keeping with the San Jose to Merced Environmental Justice Outreach Plan, the activities in this report are organized into the following outreach categories:

- Public meetings
- Stakeholder group meetings
- Local stakeholder contact

I. Public Meetings

During the reporting period, there were no Authority-hosted public meetings in the San Jose to Merced Project Section.

II. Group Stakeholder Meetings

The Authority convened five meetings with Community Working Groups (CWGs) along the San Jose to Merced project section to discuss and gather input on the 2018 Business Plan and project alternatives with community members representing a broad range of local interests. Each of the CWGs includes representatives of environmental justice communities in the project section. During the reporting period, the Authority conducted the following CWG meetings:

Meeting	Date	Location	# of Attendees	Purpose
Morgan Hill–Gilroy CWG	11/7/2018	Gilroy	20	Program Updates, San Jose to Merced Project Section, community engagement and outreach, CWG input on community resources
San Jose CWG	11/28/2018	San Jose	18	Statewide project update; review of alignment alternatives; outreach and engagement; introduction to CWG activity on community resources, community outreach, project interfaces and integration

Meeting	Date	Location	# of Attendees	Purpose
San Jose CWG	2/21/2019	San Jose	29	Rationale and process for identifying Preferred Alternative, role of the early train operator, updated flyover video, project benefits, outreach update
Morgan Hill–Gilroy CWG	3/5/2019	Morgan Hill	8	Rationale and process for identifying Preferred Alternative, role of the early train operator, updated flyover video, project benefits, outreach update
Morgan Hill-Gilroy CWG	4/22/2019	Gilroy	12	Build understanding of the safety and security characteristics of a high-speed rail system. Preview the format and types of information that will be shared about the Staff Recommended Preferred Alternative in Summer 2019. Provide an overview of the proposed process for CWG feedback on the Staff Recommended Preferred Alternative.

The following items emerged from the CWG meetings:

- Concerns regarding the relationship of the Authority to other agencies, projects and planning efforts.
    - The status of Caltrain electrification and its relation to the High-Speed Rail project.
    - Concern regarding interagency coordination and connection to other projects (e.g., Diridon Station planning).
    - Concern regarding the status of negotiations with Union Pacific and the potential impact on the selection of a preferred alternative.
    - Questions regarding the role of the Early Train Operator and its relationship to the Authority.
- Concerns regarding High-Speed Rail's potential impacts.
    - Parking and traffic
        - Concerns regarding impacts to parking availability.
        - Concerns regarding the impact of at-grade crossings on traffic congestion, neighborhood separations, emergency vehicle access, and connectivity.
    - Property
        - Concern regarding impacts to agricultural land in San Martin (especially in Alternative 3).
        - Concern regarding potential impacts to existing infrastructure depending on which alternative is selected.
        - Concern that a viaduct would significantly impact many neighborhoods.
    - Safety
        - Concerns that more frequent trains pose a greater safety risk.
        - Concern regarding the consistency and efficacy of pedestrian crossings across the corridor.
        - Concern regarding the vulnerability of High-Speed Rail to terrorist attacks.

        - Concerns regarding the design, operation and efficacy of safety features (including fencing, quad gates, Automatic Train Control, barrier skirt)
    - Noise and vibration
- Concerns regarding methodology.
    - Concern regarding the metrics being used for evaluating impacts to buildings and agricultural land.
    - Interest in the methodology used for traffic analysis in the environmental document.
    - Concern that safety is not considered a differentiating factor in comparing alternatives.
- Concerns regarding project viability.
    - Concern regarding levels of funding and responsibility for grade separation projects.
    - Concern about the project status given the 2019 State of the State address.
    - Concern about project schedule, delays, and funding.
- Concerns regarding public input.
    - Recommendation to expand outreach efforts and to provide more opportunities for input (i.e., a process for providing comments on the Staff-Recommended Preferred Alternative).
    - Interest in how public input is being incorporated and concern that CWG members' opinions will not be considered.

III. Local Stakeholder Contact

During the reporting period, the San Jose to Merced Project Section's outreach consultant participated in two local outreach events, conducted two canvasses, and led 36 stakeholder/service provider interviews.

Outreach Events

Meeting	Date	Location	# of Attendees	Purpose	Resource Partners/ Advocacy Groups
VIVO In-Language Meeting	3/6/2019	San Mateo County	30	The event purpose was to engage, for the first time, the Vietnamese community in Santa Clara County, provide updates on the project, and solicit input on the alternatives.	Vietnamese Voluntary Foundation
Volta Elementary School In-language meeting	3/26/2019	Los Banos	20	Engage the Volta Elementary School and broader community in Los Banos, provide basic information and updates on the project, and solicit input on impacts to the community.	Volta Elementary School

Neighborhood Canvasses

Meeting	Date	Location	# of Attendees	Purpose
Centennial Recreation Senior Center Canvass	11/14/2018	Morgan Hill	3	Solicit input from senior citizens living in Morgan Hill on potential impacts from High-Speed Rail.
Gardner Community Center Canvass	12/3/2018	Gardner, San Jose	4	Solicit input from community members at the Gardner Community Center regarding potential impacts from High-Speed Rail.

Stakeholder/Service Provider Interviews

Meeting	Date	Location	Organization
Kathleen Rose	11/8/2018	Gilroy	Gavilan College
Oscar Hernandez	11/9/2018	Gardner, San Jose	Biblioteca Latinoamericana
Rose Barry	11/9/2018	Gilroy	Saint Mary Parish
Deborah Flores	11/9/2018	Gilroy	Gilroy Unified School District
Kathleen Cordova	11/12/2018	Gardner, San Jose	Santa Maria Urban Ministry
Debbie Vasquez	11/14/2018	Morgan Hill	City of Morgan Hill
Joe Cuevas	11/14/2018	San Martin	Santa Clara County Social Services
Leslie Little, Tiffany Brown & Edith Ramirez	11/15/2018	Morgan Hill	City of Morgan Hill
Quyen Mai	11/15/2018	San Jose	Vietnamese Voluntary Foundation (VIVO)
Cythina Sutter-Tkel	11/20/2018	San Jose	Salvation Army Family Services
Brenda Callahan-Johnson	11/27/2018	Merced	Merced County Community Action Agency
Sal Ahkter	11/29/2018	San Martin	The Cordoba Center: South Valley Islamic Community
Patricia Mondragon	12/4/2018	Gilroy	South Valley Middle School in Gilroy
Karolinne Livingston	12/4/2018	Gilroy	Rebekah Assembly
Shannon Lane	12/4/2018	Morgan Hill	Morgan Hill Community Adult School
Cindy Reeves	12/4/2018	Morgan Hill	Learning and Loving Center
Daniel Guhl	12/4/2018	San Jose	Salvation Army Emmanuel House
Matthew Thomas	12/10/2018	Los Banos	Volta Elementary School
Joe Heim	12/10/2018	Los Banos	Los Banos Community Center
Irma Torres	12/10/2018	Los Banos	Kings View
Kevin Sved	12/14/2018	Gilroy	Navigator Schools (Gilroy Prep School)
Erin O'Brien	12/18/2018	Santa Clara County	Community Solutions
Chris Rebboah	12/20/2018	Gilroy	Rebekah Children's Services
Jeff Darling	12/21/2018	Santa Clara County	San Andreas Regional Center
Sinthia Sazio	1/8/2019	Gilroy	Head Start Program

Meeting	Date	Location	Organization
Greg Dinsmore	1/29/2019	Gilroy	Hope Services
Sally Armendariz	2/7/2019	Gilroy	CARAS South County
Christine Vasquez	2/12/2019	Gilroy	Glen View Elementary
Josh Selo	2/12/2019	San Jose	West Valley Community Services
Paul Escobar	2/14/2019	San Jose	San Jose Downtown Residents Association
Jane Stevens	2/19/2019	San Martin	San Martin Lions Club
Jan Bernstein-Chargin	2/28/2019	Gilroy	Compassion Center
Milina Jovanovic	2/28/2019	Santa Clara County	Santa Clara County Office of Immigrant Relations
Marco Sanchez	3/14/2019	Gilroy	Gilroy High School
Laura Cortez	4/18/2019	Gilroy	Alexander Station
Vicki Martin	4/22/2019	Gilroy	St. Joseph's Family Center

The following items emerged from the environmental justice outreach activities:

- Potential Impacts
    - Concern regarding neighborhood separations and the separation of communities from the services upon which they rely.
    - Concern regarding noise and vibration and the aesthetic impact of sound barriers.
    - Displacement
        - Concern that High-Speed Rail will exacerbate the lack of affordable housing and further raise housing costs.
        - Concern regarding property acquisition that may be necessary depending on the alternative selected.
    - Traffic and parking
        - Interest in how the alignment will impact congestion on local roadways.
    - Safety
        - Concern regarding security at train stations and on-board trains.
        - Concern regarding safety at grade crossings (especially near schools).
        - Concern regarding the proximity of High-Speed Rail to homeless individuals in the rail right-of-way.
- Potential Community Benefits
    - Interest in more information regarding mitigation measures to lessen impacts in environmental justice communities.
    - Concern regarding the affordability of fares and whether low-income individuals will be able to make use of High-Speed Rail.
    - Optimism that High-Speed Rail will result in additional customers for local businesses (due to increased traffic at stations).
    - Optimism that High-Speed Rail will lead to improved access to jobs and higher education (shorter commutes and reduced traffic congestion).
    - Optimism that High-Speed Rail will lead to the preservation of agricultural land (depending on the alternative selected).
- Public Engagement

    - Interest in varied modes of engagement because some populations have limited access to technology.
    - Concern that there is a lack of awareness about the project in environmental justice communities.
- Project Costs and Operation
    - Concern that taxpayer money should be spent judiciously (especially in regard to the demolition of recently constructed buildings and infrastructure).
    - Interest in fair labor practices.
    - Concern regarding project timeline, availability of funds, and viability.
    - Concern regarding the lack of funding for grade separation projects (and the associated financial burden placed on local jurisdictions).
- Connectivity
    - Concern regarding the speed and frequency of train service and connectivity to other forms of transit.
    - Concern regarding safe bicycle and pedestrian access.

[i] The Authority's definition and application of the term "environmental justice" as it relates to the High Speed Rail project is as follows: *"Environmental Justice (EJ) is the fair treatment of people of all races, cultures, and income with respect to the development, adoption, implementation and enforcement of environmental laws and policies. Implementation of environmental justice principles in how the Authority plans, designs, and delivers the high-speed rail projects means that the Authority recognizes the potential social and environmental impacts that project activities may have on certain segments of the public."* (HSR Authority, Title VI Report, 2013)

SAN JOSE TO MERCED PROJECT SECTION
ENVIRONMENTAL JUSTICE OUTREACH SUMMARY
May 1, 2019 – October 31, 2019

Overview

The following report summarizes environmental justice[i] outreach activities conducted for the California High-Speed Rail Authority (Authority) San Jose to Merced Project Section between May 1, 2019 and October 31, 2019. These activities are consistent with the overall approach and specific strategies outlined in the San Jose to Merced Environmental Justice Outreach Plan and the High-Speed Rail Project Environmental Impact Report/Environmental Impact Statement Environmental Methodology Guidelines, Version 5 (or, EMGv5).

In keeping with the San Jose to Merced Environmental Justice Outreach Plan, the activities in this report are organized into the following outreach categories:

- Public meetings
- Stakeholder group meetings
- Local stakeholder contact

I. Public Meetings

During the reporting period, there were no Authority-hosted public meetings in the San Jose to Merced Project Section. The Authority hosted open houses (focused on the selection of a preferred alternative), but these are not being included as they neither focused on environmental justice nor did they target environmental justice communities.

II. Group Stakeholder Meetings

While the Authority convened several Community Working Groups (CWGs) along the San Jose to Merced Project Section during this time period, these meetings were not focused on environmental justice topics and they did not target environmental justice communities.

III. Local Stakeholder Contact

During the reporting period, the San Jose to Merced Project Section's outreach consultant participated in 11 outreach events and also led 11 stakeholder/service provider interviews.

Outreach Events

Meeting	Date	Location	# of Attendees	Resource Partners/ Advocacy Groups
Gardner Community Meeting	5/13/2019	San Jose	17	Gardner Neighborhood Association
Gilroy Community Meeting	5/28/2019	Gilroy	4	Gilroy Unified School District

HomeFirst Homeless (Monterey Corridor)	5/31/2019	San Jose	12	
Homeless Dinner	6/13/2019	Gilroy	20	St Joseph's Family Center
PATH Homeless (Diridon)	6/14/2019	San Jose	8	
Morgan Hill Music	7/5/2019	Morgan Hill	50	Morgan Hill Chamber of Commerce
Good Morning Morgan Hill Chamber Breakfast	8/1/2019	Morgan Hill	75	Morgan Hill Chamber of Commerce
Downtown San Jose Farmers Market	8/9/2019	San Jose	60	
Gilroy Car Show	8/17/2019	Gilroy	80	
Refugee and Immigrant Forum of Santa Clara County	10/16/2019	San Jose	15	
Vietnamese Moon Festival	9/20/2019 - 9/21/2019	San Jose	90	

The following items emerged from these environmental justice outreach events:

- **Project Timeline/Sequencing/Process**
    - Interest in the project timeline (e.g., the sequencing of construction phases, coordination with local infrastructure projects, and the timing of property acquisitions) and the process for selecting a preferred alternative.
    - Concern regarding news reports of project delays, mismanagement and cost overruns.
- **Displacement/Property Impacts**
    - Interest in pinpointing the specific homes that will be affected by the project and acquired by the Authority.
    - Concern regarding potential impacts to historic buildings and public spaces (e.g., Fuller Park) and relief that the preferred alternative may minimize such displacement.
    - Concern that the project may raise housing prices.
- **Coordination with External Agencies**
    - Interest in the logistics of how the Authority will coordinate service with other transportation agencies (e.g., Union Pacific, Caltrain, Amtrak, BART, local buses)
    - Interest in how the High-Speed Rail timeline relates to the development of the Diridon Integrated Station Concept.
- **Funding**
    - Concern regarding the availability of funding to complete the project given the lack of Federal funding forthcoming.
    - Concern that additional funding will necessitate raising taxes and suggestions that support should come from technology companies in Silicon Valley (especially those providing shuttles for employees).
- **Noise**
    - Concern regarding noise impacts of train operation and interest in mitigations including quiet zones and sound walls.

- **Train Stations**
    - Interest in the location and construction timeline of train stations (including East Gilroy Station and Diridon).
    - Disappointment that there are no plans for a station in Morgan Hill.
- **Traffic**
    - Concern regarding traffic congestion at at-grade intersections, especially given the higher frequency of trains.
    - Optimism that the project may benefit all commuters by relieving traffic congestion (specifically in the Peninsula Corridor).
- **Project Benefits and Equity**
    - Concern that project benefits will not be distributed equitably and that individuals and communities with the least social/political capital will bear the greatest negative impacts.
    - Optimism regarding potential project benefits (e.g., economic opportunities for downtown Gilroy, increased commuting options especially for non-drivers, job opportunities, more investment in Gilroy, alternative means of travelling to Southern California).
- **Community Cohesion/Separation/Connectedness**
    - Optimism regarding greater access to other cities across California.
    - Concern that the project is dividing the community "both physically and spiritually."
- **Public Awareness/Outreach/Engagement**
    - Interest in having outreach materials translated into additional languages and distributed to non-English speaking communities.
    - Widespread belief that the project had been canceled.
    - Concern that the public isn't being sufficiently engaged in the process.
    - Concern that youth lack awareness of the project.
- **Homeless**
    - Concern regarding the use and proximity of high-speed rail infrastructure (e.g., train stations, tracks, tunnels, archways) to numerous existing homeless encampments; the difficulty of relocating homeless individuals, and the potential future development of similar encampments.
    - Concern for the safety of homeless individuals who cross the train tracks as part of their daily routine.
- **Safety**
    - Interest in safety features and other infrastructure that might mitigate risks, including pedestrian bridges, ramps, walls, gates, fences and caged entrance systems to the public (especially vulnerable populations such as children and the homeless).
    - Concern with safety impacts to at-risk youth living near tracks who may attempt to inflict self-harm (specifically regarding those alternatives going through downtown Gilroy that will be adjacent to Rebekah Children's Services).
    - Concern regarding safety impacts from electrification and at-grade crossings.
- **Alternatives**
    - General
        - Interest in whether there will be a single alternative for the entire project section, or if elements of different alternatives can be combined.
    - Support for Alternative 4

        - Belief that Alternative 4 would have the smallest impact on properties (including homes and historic buildings).
        - Belief that using existing tracks is the most efficient, cost-effective solution and would cause the fewest disruptions.
    - Opposition to Alternative 4
        - Concern that Alternative 4 will contribute to the Mexican community's segregation as it will serve as a barrier from the rest of Gilroy.
        - Concern with safety issues along the alignment, especially regarding schools and their proximity to tracks.
        - Concern that Alternative 4 poses the greatest risk to the Gilroy community because of the many educational institutions along the alignment.
        - Concern regarding the speed of trains under Alternative 4.
    - Opposition to Other Alternatives
        - Concern that Alternative 3 will negatively impact farmers.
        - Concern that a viaduct may disrupt traffic along Monterey Road and thereby negatively impact businesses in Gilroy and Morgan Hill.
        - Concern about the cost associated with constructing a viaduct.
    - Support for Other Alternatives
        - Preference for a viaduct in the median of Highway 101 to mitigate safety concerns.

Stakeholder/Service Provider Interviews

Meeting	Date	Location	Organization
Desarie Abeyta	6/25/2019	San Jose	Bill Wilson Center
Elizabeth Gonzalez	6/26/2019	San Jose	De-Bug
Rosalinda Aguilar & Ray Moreno	10/29/2019	San Jose	Guadalupe Washington Neighborhood Association
Mags Petkewicz	10/29/2019	Gardner	Gardner Academy
Brandon Quintanilla	10/29/2019	San Jose	Better Tomorrow
Nastaran Nazarian	10/30/2019	San Jose	PARS Equality Center
Adrienne Keel	10/17/2019	San Jose	Family and Children Services of Silicon Valley (LGBTQ Youth Program)
Vy Nguyen	10/18/2019	San Jose	San Jose Environmental Services Communications Division
Susan Norris	10/2/2019	San Jose	PG&E
Quyen Vuong	10/24/2019	San Jose	International Children Assistance Network
Jody Ngo	10/4/2019	San Jose	UStar Productions

The following items emerged from these environmental justice outreach interviews:

- **Safety**
    - Concern regarding people crossing the tracks (e.g., students accessing schools, children accessing libraries, adjacent homeless encampments, and community members who do not have cars and therefore rely on walking and bicycling).

    - Concern regarding adequate fencing and barriers.
    - Concern regarding adequate signage and the need for a public awareness campaign to warn people of danger (especially given the substance abuse and mental health issues in the homeless community).
- **Homeless Issues**
    - Concern regarding the proximity of homeless encampments to the tracks and associated safety risks and displacement.
- **Noise**
    - Concern regarding noise impacts (both during construction and once service begins).
- **Displacement**
    - Concern about increased property values leading to community members losing their homes.
- **Air Quality**
    - Concern regarding air quality impacts during construction.
- **Access/Affordability**
    - Concern that the benefits of high-speed rail will not be equitably shared if the service does not offer an affordable mode of travel.
- **Traffic**
    - Concern regarding the impact on traffic congestion, especially during school drop-off and pick-up times.
- **Project Benefits**
    - Optimism that the project will provide constituent communities with greater access to Southern California.
- **Public Outreach**
    - Concern that local EJ populations are not aware of the project.
    - Concern that materials should be translated into additional languages (e.g., Farsi).
    - Concern that EJ communities must have a voice in the process.
    - Concern that the youth have not been adequately engaged.
    - Recommendations for how best to reach various EJ communities (including collaborating with trusted local service providers, cultural events, local in-language media outlets, and door-to-door communication).

[i] The Authority's definition and application of the term "environmental justice" as it relates to the high-speed rail project is as follows: *"Environmental Justice (EJ) is the fair treatment of people of all races, cultures, and income with respect to the development, adoption, implementation and enforcement of environmental laws and policies. Implementation of environmental justice principles in how the Authority plans, designs, and delivers the high-speed rail projects means that the Authority recognizes the potential social and environmental impacts that project activities may have on certain segments of the public."* (HSR Authority, Title VI Report, 2013)

SAN JOSE TO MERCED PROJECT SECTION
ENVIRONMENTAL JUSTICE OUTREACH SUMMARY
November 1, 2019 – April 30, 2020

Overview

The following report summarizes environmental justice[i] outreach activities conducted for the California High-Speed Rail Authority (Authority) San Jose to Merced Project Section between November 1, 2019 and April 30, 2020. These activities are consistent with the overall approach and specific strategies outlined in the San Jose to Merced Environmental Justice Outreach Plan and the High-Speed Rail Project Environmental Impact Report/Environmental Impact Statement Environmental Methodology Guidelines, Version 5 (or, EMGv5).

In keeping with the San Jose to Merced Environmental Justice Outreach Plan, the activities in this report are organized into the following outreach categories:

- Public meetings
- Stakeholder group meetings
- Local stakeholder contact

I. Public Meetings

During the reporting period, there were no Authority-hosted public meetings in the San Jose to Merced Project Section.

II. Group Stakeholder Meetings

While the Authority convened several Community Working Groups (CWGs) along the San Jose to Merced Project Section during this time period, these meetings were not focused on environmental justice topics and they did not target environmental justice communities.

III. Local Stakeholder Contact

During the reporting period, the San Jose to Merced Project Section's outreach consultant participated in 15 outreach events and led 52 stakeholder/service provider interviews.

Outreach Events

Meeting	Date	Location	# of Attendees	Resource Partners/ Advocacy Groups
Gardner Elementary PTO Meeting and Community Walk	12/13/2019	San Jose	5	
Gilroy Unified School District Presentation	1/28/2020	Gilroy	4	Gilroy Unified Schools, South Valley Middle & Rebekah Children's Services

Meeting	Date	Location	# of Attendees	Resource Partners/ Advocacy Groups
Shasta Hanchett Park Neighborhood Association Fair	2/1/2020	San Jose	60	
Meet the Black Authors and Artists Event	2/1/2020	San Jose	75	African American Community Services Agency
Santa Clara Unified School District Principals	2/6/2020	Santa Clara, San Jose	8	
Guadalupe Washington Safety Coalition Community Walk	2/20/2020	San Jose	9	
Guadalupe Washington Neighborhood Association Presentation	2/20/2020	San Jose	8	
Family Fun Friday	2/21/2020	San Jose	40	African American Community Services Agency
Emergency Assistance Network Presentation	2/24/2020	San Jose	7	
Oak Grove High School Latino Parents Meeting	3/4/2020	San Jose	14	
Franklin-McKinley School District Webinar	4/16/2020	Webinar	7	
Muslim Community Association Community Webinar	4/19/2020	Webinar	9	
Edenvale Great Oaks Plan Implementation Coalition Community Webinar	4/21/2020	Webinar	6	
Madre-A-Madre Community Webinar	4/23/2020	Webinar	10	
San Jose Word of Faith Christian Center Community Webinar	4/28/2020	Webinar	5	

The following issues were identified by participants in these environmental justice outreach events:

- **Project Timeline/Sequencing/ Process**
  - Interest in project timeline (e.g., alternative selection, implementation, and project phases).
- **Displacement/Property Impacts**
  - Concern regarding loss of homes, parks, and churches to the project.
  - Interest in understanding the property acquisition process and options that owners have.
  - Concern that displacement challenges will hit lowest income families the hardest.
  - Concern that property, owned by the Authority and neighbors, will be tagged and lead to heightened gang activity.
- **Coordination with External Agencies and Organizations**
  - Recommendation for the Authority to partner with local community-based organizations (CBOs, such as homeless response teams, Complete Streets programs) on programs.

    - Recommendation for the Authority to partner with community members on beautification efforts (e.g., tree planting).
    - Interest in the relationship and coordinating logistics between the Authority and other transportation providers, especially Union Pacific and Caltrain.
- **Funding**
    - Interest in understanding how the project moves forward while funding is still pending.
- **Noise/Vibration**
    - Concern regarding noise and vibration impacts of train operation and construction.
    - Interest in approaches to and effectiveness of noise mitigation.
    - Concern regarding potential repetition of past transportation projects' unfulfilled promises to produce sound walls.
- **Train Stations**
    - Concern regarding traffic congestion and availability of parking near stations.
- **Traffic**
    - Interest in potential project outcomes that lead to reduced traffic congestion.
    - Concern about increased traffic impacts on safety and accessibility.
- **Mitigation Measures**
    - Concern about effects unable to be mitigated (e.g., displacement, environmental degradation).
    - Interest in understanding mitigation timeline, requirements, and process.
    - Concern, based on reported past experience with other agencies, that Authority may plan but not deliver mitigation.
- **Environmental Enhancements**
    - Interest in enhancements projects (e.g., traffic calming features (pedestrian crossing signs, crosswalks, bike lanes), freeway ramps, fences, playgrounds, school improvements, parks, riverside paths).
    - Concern that project impacts and enhancements benefits cannot fully be understood when projects in the vicinity are still being planned.
    - Concern that there will be unintended consequences of enhancements (i.e., new fences to tag resulting in heightened gang activity).
    - Concern about criteria used to define "environmental justice" communities along the alignment.
- **Project Benefits and Equity**
    - Concern that the environmental process does not necessarily focus on prioritizing communities and protecting the interests of residents.
    - Interest in project benefits, especially improved air quality, access to lower cost housing, traffic reduction, job access, and the connection of families.
- **Community Cohesion/Separation/Connectedness**
    - Concern about community isolation.
    - Interest in project benefit of increased mobility that will keep families connected.
- **Public Awareness/Outreach Engagement**
    - Concern regarding a perceived lack of responsiveness by the Authority to community concerns.
    - Concern regarding the community's lack of awareness or limited knowledge about the project.
    - Interest in learning about commuter fares, requirements to ride (i.e., identification), and train schedules and volumes.

- Interest in the activities and logistics (e.g., open houses, access for those with technological constraints) and methods for engaging stakeholders for the Draft EIR/EIS comment period.

- **Safety**
  - Interest in collaborating with homeless response teams to abate the homeless population and activities along the tracks.
  - Concern regarding emergency vehicle response times and ensuring public safety personnel have direct access to communities.
  - Interest in developing and maintaining safety features (e.g., grade separations, pedestrian overcrossings, traffic safety, pedestrian crossing signs and lights, secure fencing around tracks, lights near new structures).
- **Alternatives**
  - Interest expressed for underground alternatives.
  - Interest in understanding costs differences and displacement effects of each alternative.

Stakeholder/Service Provider Interviews

Meeting	Date	Location	Organization
Claudia Olaciregui	11/4/2019	San Martin	San Martin/Gwinn K-8 Academy
Brandon Quintanilla	11/6/2019	San Jose	Better Tomorrow
Steve Betando	11/20/2019	Morgan Hill	Morgan Hill Unified School District
Dan Keith & Dan Rocca	11/20/2019	San Martin	Rocca's Market
Jim Di Vittorio	11/20/2019	Morgan Hill/San Martin	Maple Leaf RV Park
Kathy Robinson	12/9/2019	Santa Clara	HomeSafe/Charities Housing
Jose Rojo & Jose Serrano	12/9/2019 & 12/13/2019	Santa Clara County	Univision
Thong Vang	12/12/2019	San Jose	San Jose City College
Erick Morales & Christian de le Cruz	12/13/2019	San Jose	La Raza Radio
Kathy Robinson	12/16/2019	Santa Clara	Charities Housing
Aparna Dhoraje	12/17/2019	Santa Clara	Next Door Solutions
Tony Cuevas	12/18/2019	Gilroy	Santa Clara County Family & Children Services
Matthew Thomas	12/19/2019	San Joaquin Valley	Volta Elementary
Alvaro Meza, Guillermo Ramos & Kevin Sved	12/19/2019	Gilroy	Gilroy Unified School District
Joe Heim	12/20/2019	Los Banos	Los Banos Community Center
Sujatha Venkatraman	1/8/2020	San Jose Diridon	West Valley Community Services
Victoria Sorensen & Jessie Swift	1/15/2020	Morgan Hill	Morgan Hill Unified School District & CARE
Martin Enriquez	1/15/2020	Gilroy	Gilroy High School

Meeting	Date	Location	Organization
Rebecca Garcia, Edith Ramirez & Tiffany Brown	1/15/2020	Morgan Hill	City of Morgan Hill
Kathleen Rose & Denée Pescarmona	1/15/2020	Gilroy	Gavilan College
Stella Kemp & Jennifer Derrico	1/16/2020	Santa Clara	Santa Clara Unified School District
Deacon Ruben Solorio	1/16/2020	San Jose	Sacred Heart Nativity
Adrienne Keel	1/17/2020	South San Jose	Family & Children's Services of Silicon Valley, County of Santa Clara
Josue Fuentes & Hugo Meza	1/22/2020	Guadalupe Washington	Guadalupe-Washington Safety Coalition
Blake Balajadia	1/23/2020	San Jose	San Jose City College
Milan Balinton	1/23/2020	San Jose	African American Community Services Agency
Kristine Nguyen	1/23/2020	San Jose	Go Kids (formerly Estrella Family Services)
Ben Spielberg	1/23/2020	San Jose	San Jose Unified School District
Corrin Reynolds	1/28/2020	Gardner/San Jose Diridon/Guadalupe Washington	San Jose Unified School District
Amer Iqbal & Matthew Thomas	1/29/2020	Los Banos	Los Banos Unified School District
Janine Ramirez & Ernest Alnas	1/29/2020	Alma	Rocketship Public Schools
Chris Funk & Chris Jew	1/30/2020	San Jose	East Side Union High School District
Juan Carlos Villasenor & Mari de Solorzano	1/30/2020	San Jose	Voices Charter Academy
Yves Zsutty	2/3/2020	San Jose	City of San Jose Parks/Trails
Michelle Covert, Serge Lilavois, Frances Hernandez & Beatriz Ramos	2/6/2020	Santa Clara/San Jose	Homeless Service Providers
Jose Manzo & Laura Phan	2/6/2020	San Jose	Oak Grove Elementary School District
Maricela Alcala Franco	2/6/2020	San Jose	Washington Elementary
Aliza Kazmi	2/7/2020	Santa Clara/San Jose	Council on American Islamic Relations (CAIR)
Glenna Williams & Hezekiah Alexander	2/7/2020	San Jose	San Jose Word of Faith Christian Center Board
Quyen Vuong	2/7/2020	San Jose	ICAN Family Resource Center
Esther Peralez-Dieckmann	2/10/2020	Santa Clara	NextDoor Solutions
Daniel Peck	2/10/2020	Santa Clara	Missing College
Hermelinda Sapien	2/20/2020	San Jose	Center for Employment Training (CET)
Janine Ramirez, Ernest Alnas, Justin White, Adiagha Mbonisi, Debesay Teklemariam, Ana Velasquez & Leticia Bermudez	2/26/2020	San Jose	Rocketship Mateo Sheedy Elementary

Meeting	Date	Location	Organization
Aparna Dhoraje, Maria Rosas & Daniela Maldonado	2/26/2020	Santa Clara	Next Door Solutions/Home Safe
Frances Hernandez, Michael Freyer & Catalina Lopez	2/27/2020	Santa Clara/San Jose	HomeFirst Service Area Assessment
Athar Siddiqee	2/28/2020	Santa Clara/San Jose	South Bay Islamic Association (SBIA)
Brett Bymaster	3/10/2020	San Jose	Tamien Community Organizer
Philip Nguyen	3/12/2020	San Jose	Vietnamese American Round Table
Peter Nguyen	3/12/2020	San Jose	Vietnamese Voluntary Foundation (VIVO)

The following issues were identified by participants in these environmental justice outreach interviews:

- **Safety**
  - Concern regarding potential hazards of local tracks (e.g., children accessing school, older adults, unhoused populations, those looking to self-harm).
  - Recommendation to consult neighborhoods before adding barriers to prevent unintended consequences (i.e., gang activity could increase with new fences/walls).
  - Interest in measures to mitigate the impacts of natural hazards.
  - Concern regarding emergency vehicle response times and ensuring public safety personnel have direct access to communities.
- **Homelessness**
  - Concern regarding the displacement of homeless encampments that are currently located within close proximity of high-speed rail infrastructure (e.g., train stations, tracks, tunnels, archways).
  - Concern regarding the creation of new homeless encampments (e.g., Coyote Valley Wildlife, below bridges) and an increase in crime associated with encampments (i.e., an uptick in illicit drugs and theft).
  - Interest in the provision of housing for unhoused communities living along the corridor.
- **Noise & Vibration**
  - Concern regarding noise and vibration impacts of train operation and interest in mitigation measures.
- **Displacement/Property Impacts**
  - Interest in understanding the extent to which properties will be impacted.
  - Concern regarding gentrification and its impact on communities, especially low-income residents and students.
  - Concern regarding the potential for vandalism and graffiti as a result of the installation of barriers like sound walls.
- **Partnerships**
  - Interest in project partnerships (i.e., schools and workforce training programs that could be cosponsored by the Authority).
- **Funding**
  - Concern regarding the availability of funding to complete construction of the project.
- **Project Benefits and Equity**
  - Concern about the potential lack of social and economic investment in disadvantaged communities, especially Black and Latino communities.

    - Optimism that the project will hire locally and improve quality of life through access to affordable housing.
- **Community Cohesion/Separation/Connectedness**
    - Concerns regarding potential impacts to community cohesion and access to jobs on either side of high-speed rail tracks.
    - Concern that there will be disruptions to businesses during construction.
- **Public Awareness/Outreach/Engagement**
    - Concern that Latinx communities in the Bay Area are not aware of the project.
    - Recommendations for how best to reach various EJ communities: incentivizing members and businesses to provide feedback and referrals, contracting local nonprofits for consultation services to participate in outreach, and developing materials specific to each community.
- **Access/Affordability**
    - Optimism that the project will increase access to services and businesses throughout California.
    - Interest in what the fare will be.
    - Interest in train schedules and their relationship to peak travel times.
- **Traffic & Parking**
    - Concern regarding the impact on traffic congestion during peak hours (e.g., school drop-off and pick-up times).
    - Concern regarding the availability of parking, which is already seen as limited.
    - Concern regarding disruption to bus routes, including school bus routes, during both construction and operation.
- **Alternatives**
    - General
        - Interest in the selection process for Alternative 4 as the Preferred Alternative.
    - Support for Alternative 4
        - Belief that Alternative 4 would have the lowest impact on residential properties and businesses.
        - Concern about the viaduct in other Alternatives.
    - Opposition to Alternative 4
        - Concern that Alternative 4 may negatively impact some residential areas.
    - Support for Other Alternatives
        - Preference for Alternative 1 through Morgan Hill to avoid downtown and reduce disruption of bus routes.
- **Environmental Enhancements**
    - Interest in environmental enhancements, including safety barriers, noise/vibration mitigation, public transportation improvements, active transportation infrastructure (e.g., bikes lanes, sidewalks, pedestrian crossings, lights and bridges), affordable housing for unhoused communities, better access to services (e.g., signage for emergency services, vouchers for hotel stays, mobile showers program, mobile health clinics), subsidized transit fares, training and employment opportunities, public space improvements, and property improvements.
    - Interest in the enhancements process., including types of enhancements, selection criteria, and rating system.
    - Interest in improved public spaces and investment in new spaces

[i] The Authority's definition and application of the term "environmental justice" as it relates to the high-speed rail project is as follows: *"Environmental Justice (EJ) is the fair treatment of people of all races, cultures, and income with respect to the development, adoption, implementation and enforcement of environmental laws and policies. Implementation of environmental justice principles in how the Authority plans, designs, and delivers the high-speed rail projects means that the Authority recognizes the potential social and environmental impacts that project activities may have on certain segments of the public."* (HSR Authority, Title VI Report, 2013)

SAN JOSE TO MERCED PROJECT SECTION
ENVIRONMENTAL JUSTICE OUTREACH SUMMARY
May 1, 2020 – October 30, 2020

Overview

The following report summarizes environmental justice[i] outreach activities conducted for the California High-Speed Rail Authority (Authority) San Jose to Merced Project Section between May 1, 2020 and October 30, 2020. These activities are consistent with the overall approach and specific strategies outlined in the San Jose to Merced Environmental Justice Outreach Plan and the High-Speed Rail Project Environmental Impact Report/Environmental Impact Statement Environmental Methodology Guidelines, Version 5 (or, EMGv5).

In keeping with the San Jose to Merced Environmental Justice Outreach Plan, the activities in this report are organized into the following outreach categories:

- Public meetings
- Stakeholder group meetings
- Local stakeholder contact

I. Public Meetings

While the Authority hosted three virtual public open houses and a virtual public hearing along the San Jose to Merced Project Section during this time period, these events were not focused on environmental justice topics and they did not target environmental justice communities.

II. Group Stakeholder Meetings

While the Authority convened several Community Working Groups (CWGs) along the San Jose to Merced Project Section during this time period, these meetings were not focused on environmental justice topics and they did not target environmental justice communities.

III. Local Stakeholder Contact

During the reporting period, the San Jose to Merced Project Section's outreach consultant participated in 6 outreach events and led 16 stakeholder/service provider community enhancements engagements.

Outreach Events

Meeting	Date	Location	# of Attendees	Resource Partners/ Advocacy Groups
Franklin-McKinley School District Webinar	4/16/2020	Webinar	7	
Muslim Community Association Community Webinar	4/19/2020	Webinar	9	

Meeting	Date	Location	# of Attendees	Resource Partners/ Advocacy Groups
Edenvale Great Oaks Plan Implementation Coalition Community Webinar	4/21/2020	Webinar	6	
Madre-A-Madre Community Webinar	4/23/2020	Webinar	10	
San Jose Word of Faith Christian Center Community Webinar	4/28/2020	Webinar	9	
Santa Clara County Refugee and Immigrant Forum Announcement	6/17/2020	Webinar	N/A	

The following issues were identified by participants in these environmental justice outreach events:

- **Project Timeline/Sequencing/ Process**
  - Interest in project timeline (e.g., alternative selection, implementation, and project phases).

- **Coordination with External Agencies and Organizations**
  - Interest in the relationship between the Authority and other transportation providers, especially Union Pacific.

- **Noise/Vibration**
  - Concern regarding noise and vibration impacts of train operation and construction.
  - Interest in approaches to and effectiveness of noise mitigation such as sound walls, especially in areas around public institutions (e.g., schools and churches).

- **Traffic**
  - Concern about increased traffic impacts on safety and accessibility.
  - Concern about congestion owning to the closure of car lanes during construction.

- **Public Awareness/Outreach Engagement**
  - Interest in learning about commuter fares, requirements to ride (i.e., identification), and train schedules and volumes.
  - Interest in the activities and logistics (e.g., open houses, access for those with technological constraints) and methods for engaging stakeholders for the Draft EIR/EIS comment period.
- **Safety**
  - Concern regarding potential hazards of at-grade intersections.
  - Safety in communities adjacent to tracks.

Stakeholder/Service Provider Community Enhancements Meetings

Meeting	Date	Location	Organization
Fouad Khatib	4/10/2020	Webinar	Muslim Community Association
Steve Betando & Kirsten Perez	7/20/2020	Webinar	Morgan Hill Unified School District

Meeting	Date	Location	Organization
Tiffany Brown & Edith Ramirez	7/22/2020	Webinar	City of Morgan Hill
Antoinette Romeo & Jeremy Farr	7/23/2020	Webinar	Santa Clara County Parks & Recreation Department
Christophe Rebboah	7/24/2020	Webinar	Rebekah Children's Services
Milan Balinton	7/27/2020	Webinar	African American Community Service Agency
Kathleen Rose, Denee Pescarmona, Michael Renzi & Jan Chargin	7/27/2020	Webinar	Gavilan College
Kraig Tambornini, Julie Wyrick, Gary Heap, Girum Awoke & Cindy McCormick	7/28/2020	Webinar	City of Gilroy
Michael Liw	7/28/2020	Webinar	City of Santa Clara
Amer Iqbal, Alejandra Garibay & Matt Thomas	7/29/2020	Webinar	Los Banos Unified School District
Alvaro Mesa & Guillermo Ramos	7/29/2020	Webinar	Gilroy Unified School District
Hermelinda Sapien & Rosa Maritza Ontiveros	7/30/2020	Webinar	Center for Employment Training (CET)
Yves Zsutty, Brian Stanke, Stacey Lu & Tala Fatolahzadeh	7/30/2020	Webinar	City of San Jose & San Jose Department of Parks & Recreation
David Lovato, Jason Kim & John Sighamony	7/30/2020	Webinar	Santa Clara VTA
Beatriz Ramos & Michelle Covert	7/31/2020	Webinar	Homeless Service Providers
Ben Spielberg & Brian Stanke	7/31/2020	Webinar	San Jose Unified School District

The following issues were identified by participants in these environmental justice community enhancements engagements:

- **Safety**
  - Concern regarding potential hazards of at-grade intersections.

- **Noise & Vibration**
  - Concern regarding noise impacts of train operation.

- **Environmental Enhancements**
  - Concern regarding funding, particularly the possibility of a delay in the distribution of funds leading to a misalignment with stakeholder needs at that time.
  - Optimism about the benefits of enhancement projects on the broader community (e.g., increased access to technology and recreational space as well as improved safety).
  - Uncertainty about prioritizing feedback and defining roles, particularly for multi-agency projects.
  - Recommendations to edit sections of the enhancement profiles provided by the Authority (clarify, update and/or correct important terms, needs and requests).

[i] The Authority's definition and application of the term "environmental justice" as it relates to the high-speed rail project is as follows: *"Environmental Justice (EJ) is the fair treatment of people of all races, cultures, and income with respect to the development, adoption, implementation and enforcement of environmental laws and policies. Implementation of environmental justice principles in how the Authority plans, designs, and delivers the high-speed rail projects means that the Authority recognizes the potential social and environmental impacts that project activities may have on certain segments of the public."* (HSR Authority, Title VI Report, 2013)

SAN JOSE TO MERCED PROJECT SECTION
ENVIRONMENTAL JUSTICE OUTREACH SUMMARY
November 1, 2020 – April 30, 2021

Overview

The following report summarizes environmental justice[i] outreach activities conducted for the California High-Speed Rail Authority (Authority) San Jose to Merced Project Section between November 1, 2020 and April 30, 2021. These activities are consistent with the overall approach and specific strategies outlined in the San Jose to Merced Environmental Justice Outreach Plan and the High-Speed Rail Project Environmental Impact Report/Environmental Impact Statement Environmental Methodology Guidelines, Version 5 (or, EMGv5).

In keeping with the San Jose to Merced Environmental Justice Outreach Plan, the activities in this report are organized into the following outreach categories:

- Public meetings
- Stakeholder group meetings
- Local stakeholder contact

I. Public Meetings

During the reporting period, there were no Authority-hosted public meetings in the San Jose to Merced Project Section.

II. Group Stakeholder Meetings

While the Authority convened several Community Working Groups (CWGs) along the San Jose to Merced Project Section during this time period, these meetings were not focused on environmental justice topics, and they did not target environmental justice communities.

III. Local Stakeholder Contact

During the reporting period, the San Jose to Merced Project Section's outreach consultant participated in 1 outreach event and led no stakeholder/service provider interviews.

Outreach Events

Meeting	Date	Location	# of Attendees	Resource Partners/ Advocacy Groups
Independence High School/Engineering Academy meeting	3/25/2021	Webinar	30	N/A

Participants in the above outreach event were given the opportunity to ask questions about California High-Speed Rail but did not raise any concerns about the project.

[i] The Authority's definition and application of the term "environmental justice" as it relates to the high-speed rail project is as follows: *"Environmental Justice (EJ) is the fair treatment of people of all races, cultures, and income with respect to the development, adoption, implementation and enforcement of environmental laws and policies. Implementation of environmental justice principles in how the Authority plans, designs, and delivers the high-speed rail projects means that the Authority recognizes the potential social and environmental impacts that project activities may have on certain segments of the public."* (HSR Authority, Title VI Report, 2013)

APPENDIX 5-B, ATTACHMENT D: ENVIRONMENTAL JUSTICE OUTREACH, SEPTEMBER 2021

ENVIRONMENTAL JUSTICE OUTREACH, SEPTEMBER 2021

Overview

In September 2021, the California High-Speed Rail Authority (Authority) conducted a total of 26 virtual meetings (Figure 1) with Implementing Partners, Community Organizations, and Interested Parties and Other Stakeholders in eight communities within the San Jose to Merced Project Section, including Santa Clara/North San Jose, San Jose Diridon, Gardner/North Willow Glen, Guadalupe/Washington/Tamien/Alma/Almaden, South San Jose, Morgan Hill, Gilroy, and San Joaquin Valley, where the San Jose to Merced Project Section Environmental Impact Report (EIR)/Environmental Impact Statement (EIS) analysis had indicated that low-income populations and minority populations may be subject to disproportionately high and adverse effects (DHAE) from the project alternatives. A schedule of these meetings is provided in Attachment D1, Schedule of September 2021 Meetings. Generally, the objectives of these meetings were to:

- Explain the updated environmental justice analysis for the San Jose to Merced Project Section EIR/EIS, including updated and new mitigations, consideration of benefits, and potential community improvements
- Share preliminary conclusions related to the updated environmental justice analysis
- Gain feedback on the updated environmental justice analysis, preliminary conclusions, and potential community improvements.

Stakeholders Engaged

The Authority classified stakeholders engaged into three general categories: (1) Implementing Partners, (2) Community Stakeholders, and (3) Interested Parties and Other Stakeholders, based on the level of anticipated feedback and role in implementing the potential community improvements, described by community as follows:

- *Implementing Partners*: The Authority met one-on-one and in small groups with eight entities (below) able to partner with the Authority on specific potential community improvement implementation. Feedback from Partners was anticipated to be focused on updated potential community improvements.
    1. City of Santa Clara
    2. City of San Jose
    3. San Jose Unified School District
    4. City of Morgan Hill
    5. Morgan Hill Unified School District
    6. City of Gilroy
    7. Gilroy Unified School District
    8. Los Banos Unified School District
- *Community Stakeholders*: The Authority scheduled eight virtual community forums to meet with community members, groups, and representatives (below) experiencing project DHAEs and who had interest in how mitigation, benefits, and improvements are applied based on updated environmental justice analysis and conclusions. Implementing Partners (above), organizations representing multiple communities, and Interested Parties and Other Stakeholders (below) were invited to their respective community meeting(s). All meetings were conducted with either Spanish and/or Vietnamese interpretation and closed captioning accommodations. Feedback from community stakeholders was focused on the list of potential community improvements. The following groups were invited to the community forums; only some of the invitees attended. As compared to Phase One, when all community groups listed below actively participated in meetings and provided feedback, only a few of those groups attended meetings in Phase Three.

Santa Clara/North San Jose

1. Santa Clara Unified School District
2. Charities Housing/HomeSafe
3. Council on American Islamic Relations (CAIR)
4. Muslim Community Association (MCA)
5. Next Door Solutions
6. South Bay Islamic Association (SBIA)

San Jose Diridon

7. Delmas Park Neighborhood Association
8. Minority Business Consortium
9. PATH
10. Silicon Valley De-Bug
11. SIREN

Gardner

12. San Jose Word of Faith Christian Center
13. Gardner Elementary School
14. Gardner Neighborhood Association
15. GoKids
16. Danny Garza, Community Leader

Guadalupe Washington

17. Guadalupe Washington Neighborhood Association
18. Guadalupe Washington Neighborhood Safety Coalition
19. Washington Elementary School
20. Sacred Heart Nativity Middle School and Parish
21. Brett Bymaster, Community Leader
22. Madre a Madre
23. Biblioteca Latinoamericana

South San Jose

24. East Side Union High School District
25. Franklin McKinley School District
26. Better Tomorrow, San Jose
27. Edenvale Library
28. ECOPIC Neighborhood Action Coalition
29. Family & Children Services of Santa Clara County
30. PARS Equality Center
31. Roundtable Neighborhood Association
32. Vietnamese American Roundtable
33. Vietnamese Voluntary Organization

Morgan Hill

34. Coordinated Advocacy & Resources for Education (CARE)
35. Morgan Hill Unified School District Community
36. Voices Charter School

Gilroy

37. CARAS South County
38. Gilroy Prep School (elementary)
39. South Valley Middle School
40. Gilroy High School
41. Alexander Station

San Joaquin Valley

42. Los Banos Community Center
43. Volta Elementary School

Cross Community

44. HomeFirst
45. Silicon Valley Rising
46. Refugee and Immigrant Forum

- *Interested Parties and Other Stakeholders*: The Authority met one-on-one and in small groups with entities (below) who have direct or representative interest in potential community improvements or other improvements considered but not necessarily a partnership role. Similar to Partners, feedback from these entities was anticipated to be focused on updated potential community improvements, also considering their feedback in Phase Two on the list of other improvements considered.

San Jose Diridon

1. African American Community Services Agency (AACSA)

Guadalupe Washington

2. Rocketship Elementary School – Mateo Sheedy

South San Jose

3. Oak Grove School District

Gilroy

4. Rebekah Children's Services

Cross Community

Communication, Outreach Materials, and Presentation

In mid-summer 2021, the Authority initiated Phase Three with several rounds of email communications to environmental justice stakeholders (described above) regarding the September 2021 outreach effort. These communications included save-the-date flyers, accommodations surveys, and proposed content to be presented. On September 3, 2021, all environmental justice stakeholders received a comprehensive packet of materials related to the updated environmental justice analysis specific to their community via a unique website link, including information illustrated in Figure 1 (see Attachment D2, Copy of Outreach Materials Distributed, for a copy of the materials). The Authority requested stakeholders review the materials and provide feedback via electronic survey, letter, or other written form by October 1, 2021. All materials were translated into Spanish and/or Vietnamese and were ADA compliant.

- *Community Survey*. This survey contains a series of questions about stakeholder views on project effects, direct mitigation, project benefits, the offsetting value of project benefits and community improvement impacts, and preliminary conclusions of the updated environmental justice analysis.
- *Environmental Justice Analysis Process Summary.* This summary included a glossary of key terms and an environmental justice process graphic and description.
- *Summary of Updates to the EIR/EIS Environmental Justice Analysis*. This summary included information about the environmental justice analysis, mitigation, project benefits, and potential community improvements. The list of community improvements included potential improvements identified by the Authority to advance and other improvements the Authority had considered prior to the updated analysis.
- *Environmental Justice Community Summary*. This summary included a summary of project effects on environmental justice populations, evaluation of project benefits and potential community improvements, preliminary conclusions, and a community study area visual.
- *Meeting Agenda and Presentation.* The Authority presented on the following topics at each meeting, with the goal of providing detailed explanation and clarification on the outreach materials provided:
    - Environmental Justice Requirements
    - Environmental Justice Analysis Process
    - Updated Environmental Justice Analysis
    - Community Effects Review
    - Community Survey
    - Next Steps

  A PowerPoint presentation for each meeting was uploaded to the respective community website after each meeting.

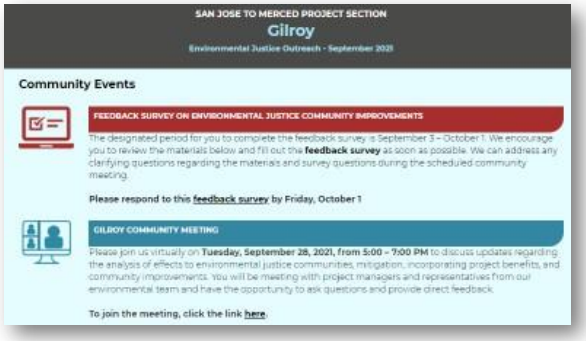
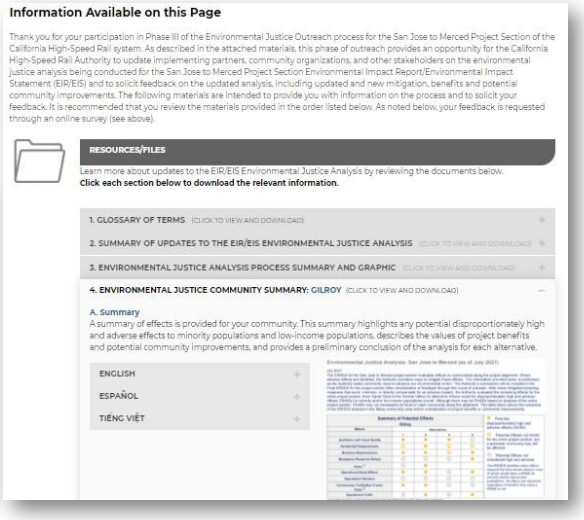
- Entering this password: HSR_EJ2021





Community Feedback Results and Documentation

The Authority catalogued all feedback that environmental justice stakeholders provided during the meetings, through the community survey, and by other written means. A synthesis of Phase Three feedback follows.

Feedback Results. Phase Three outreach activities concluded in late September 2021, and on October 1, 2021, the Authority received feedback responses as follows:

- Three comment letters from the City of San Jose, the City of Morgan Hill, and Gilroy Unified School District (see Attachment D3, Comments Submitted During September 2021 Outreach Period).
- 24 feedback responses via the electronic survey (raw data and synthesized details are provided in Attachment D4, Survey Results and Survey Forms Submitted):
    - 19 from representatives/agencies
    - 5 from individuals

The following is a high-level summary of key themes from the community feedback.

- *Impacts of concern.*
    - Impacts of concern were rated on a 5-point scale (not concerned, slightly concerned, somewhat concerned, moderately concerned, very concerned).
    - Project impacts were on average identified in the survey as being moderately concerning (construction and operational traffic, bus transit delay, residential displacements, emergency vehicle response delays, operational noise), and a few project impacts were on average identified as being somewhat concerning (visual aesthetics, commercial displacements, and partial acquisition of park/play areas).
        - The highest rated impact of concern was traffic delay during construction.

        - The lowest rated impact of concern was visual aesthetics (which was still 3.1 on a 5-point scale).

- *Value of project benefits.*
    - Benefits were rated on a 5-point scale (not beneficial, slightly beneficial, somewhat beneficial, moderately beneficial, very beneficial).
    - On average, project benefits were seen as moderately beneficial for most highlighted benefits in the survey (train travel; access to jobs, goods, and services; integration with transit; reduction of highway traffic; upgrades to railroad safety and signaling systems; reduced air pollution and greenhouse gas emissions; construction and operational spending and employment; and support for transit-oriented development near stations), with one benefit (reduced need for airport and highway expansion) rated as somewhat beneficial.
        - The highest rated benefits were reduced air pollution and greenhouse gas emissions.
        - The lowest rated benefit was the reduced need for airport and highway expansion (which was still 3.2 on a 5-point scale).
- *Concurrence with environmental justice conclusions regarding DHAEs that were presented.*
    - After application of mitigation only, slightly more respondents agreed than disagreed, but half neither agreed nor disagreed, with the preliminary conclusions concerning DHAEs presented in the updated EIR/EIS analysis. One respondent elaborated on their position:
        - The Gilroy Unified School District stated that the safety risks at crossings due to the high speed of the train remain disproportionately high and adverse for students and elderly community members even after application of the quad gates, other project safety measures, and site-specific traffic mitigation measures. The district supported the site-specific traffic mitigation measures in and of themselves, though they did not fully address the safety issues for the schools without the potential pedestrian/bike overcrossing at IOOF Avenue.
    - After application of mitigation, benefits, and community improvements, more respondents agreed than disagreed with the preliminary conclusions concerning DHAEs presented in the updated EIR/EIS analysis, but many neither agreed nor disagreed or skipped the question. Several respondents elaborated on their positions:
        - The City of Morgan Hill stated that Alternative 4 will have safety impacts on emergency vehicle response times caused by traffic delay or road closures, that the noise treatments for residences along U.S. Highway (US) 101 would not help offset noise effects along the downtown alignment of Alternative 4, and that the proposed community benefits are not addressing the main concerns the community has.
        - The City of San Jose concurred with the community noise improvements for the four communities in San Jose and requested the Authority work with existing community organizations to do outreach to the most disadvantaged residents to assist them in applying for and receiving noise insulation improvements.
        - The City of San Jose stated that they think the DHAEs related to noise, traffic, and emergency vehicle response delays did not fully address cumulative effects, which they opined could only be adequately addressed through grade separations at the five at-grade crossings in San Jose.
- *Concurrence on traffic impacts addressed by traffic mitigation.*

- After application of site-specific traffic mitigation only, approximately half of the respondents disagreed, a few agreed, and the rest neither agreed nor disagreed with the impact conclusions presented in the updated EIR/EIS analysis.
    - The City of Morgan Hill specifically questioned why no community improvements were proposed for traffic and disagreed that traffic effects would be offset by project transportation benefits.
    - Morgan Hill Unified School District said that the addition of high-speed rail (HSR) trains will increase school bus travel times.
    - The City of Gilroy noted that additional trains will create a significant amount of gate-down time.

- *Agreement with the potential list of community improvements or other improvements proposed.*
    - Twelve respondents proposed different community improvements than the ones on the potential lists. One respondent elaborated on the reason they disagreed with the potential improvement and why their proposed improvement would best serve their community's interest:
        - Oak Grove School District in San Jose asserted that an improvement to their recreational facilities, an important community hub, would be of greater and longer-term benefit to the school community and the public in that area than the proposed noise treatments at individual residences.
    - A summary of the alternative community improvements proposed by community members or agencies and why they were suggested is provided in Table 1.

- *Consistent comments in specific geographic areas.*
    - In San Jose, Morgan Hill, and Gilroy, noise, traffic, and emergency response effects were most commonly the focus of concern for comments expressing opinions that more should be done than is currently being proposed.
    - In Washington/Guadalupe, there was a consistent concern about the project's effect on homeless encampments (Tamien/State Route 87). More specifically, concerns were expressed by Sacred Heart, the Office of Supportive Housing, and in the community meeting, and support was expressed for the Authority partnering with service agencies in regard to potential displacement.

- *Other general comments on implementation of community improvements.*
    - One community organization urged the Authority to think about who is getting hurt the most when projects like this take place. This same organization urged the Authority to consider actionable/sustainable improvements that can be made to show that the Authority understands and listens to what the community actually wants.
    - The City of Gilroy stated they would like to see some of these improvements implemented sooner, prior to construction of the HSR facilities.

- *Feedback on the Authority's outreach/engagement process.*
    - Most respondents thought the survey was a helpful tool in providing feedback for the September 2021 outreach.
    - Some respondents expressed appreciation for the uthority's efforts in reaching out concerning the environmental analysis and community improvements.
    - The City of Santa Clara expressed concern that the methodology for considering community improvements appeared to have changed since mid-2020 and that many of the City's suggestions appeared to not be proposed now due to cost concerns, which may mean the City's prior efforts in developing information about potential community improvements was disregarded.

Documentation. The Authority produced an After-Action Report for the 26 meetings conducted in Phase Three, documenting the date and time of each meeting, participants, key points of concern, any preliminary feedback to directed questions, a description of questions and responses, and any next steps and follow-up actions. Copies of the After-Action Reports are included in Attachment D5, After-Action Reports for September 2021 Meetings.

Table 1 Community Improvements Suggested During September 2021 Outreach

Respondent Name	Community	Improvement Description	Reasons Proposed	Reasons Cited As Better Addressing Concerns in the Community
Center for Employment Training (CET)	Multiple	The Authority should partner with local nonprofits and community-serving agencies in filling the construction and operations jobs that this project will create.	This would support the economic development of the local community and increase support for the project.	N/A
Santa Clara County Office of Supportive Housing Sacred Heart Washington/Guadalupe Community Meeting (previous input from other community service organizations)	Multiple (but especially San Jose in Washington, Guadalupe, Tamien, and South San Jose)	Provide flexible financial assistance for people experiencing homelessness to assist with their relocation.	People experiencing homelessness will be displaced by the proposed project, especially at areas with high concentration of homeless encampments along SR 87 (adjacent to Gardner/North Willow Glen, Washington, Guadalupe) and in South San Jose but also likely elsewhere.	Santa Clara County has a housing crisis, which is a priority issue for the County to address.
City of Santa Clara	Santa Clara	Multimodal improvements such as suggested by the City of Santa Clara DPW and listed as "Other Improvements Considered": El Camino and Benton Street Safety Improvements; El Camino Real Class IV Bikeway; Pedestrian safety improvements (included sidewalk gap closure and pothole repair), Streetscape Improvements, Newhall Street Bicycle/Pedestrian Crossing.	These improvements will improve quality of life for residents and stakeholders in the affected area.	The local improvements would help community residents more readily and safely access Caltrain and HSR in the future, and current congestion levels prevent them doing this more readily.

Respondent Name	Community	Improvement Description	Reasons Proposed	Reasons Cited As Better Addressing Concerns in the Community
African American Community Services Association (AACSA)	San Jose Diridon	Reestablish the Inez Jackson Library at the AACSA community center in San Jose.	When significant changes are made to communities, underserved populations are hit the hardest and are the slowest to recover. Many will be affected throughout the high-speed rail development process, so improving the Inez Jackson Library at the very least will show we care and understand the needs of our community. The library could provide a "quiet space" for community members to help offset noise effects from existing noise and from the train.	Reestablishment of the Inez Jackson Library is necessary because it serves our at-risk populations. I just want to stress again the importance of reestablishing the Inez Jackson Library. Many youth programs have operated out of that location, and it plays a significant role in their development and gives parents a hub to bring their children.
City San Jose	San Jose Diridon, Washington/Guadalupe, South San Jose	The Authority should negotiate an agreement with Caltrain to not sound horns at the Diridon, Tamien, Capitol, and Blossom Hill Caltrain Stations.	Reducing noise effects	N/A
City San Jose	San Jose Diridon	Grade separation at Auzerais separately or through DISC. The Authority should commit to participate in and proportionally fund DISC.	Reduce noise, traffic, and safety (including emergency vehicle response) effects on community.	Grade separation would remove noise effects associated with increased at-grade horn sounding at Auzerais.
City San Jose	Gardner/North Willow Glen	Grade separation at West Virginia separately or through DISC. The Authority should commit to participate in and proportionally fund DISC.	Reduce noise, traffic, and safety (including emergency vehicle response) effects on community.	Grade separation would remove noise effects associated with increased at-grade horn sounding at West Virginia.
City San Jose	Gardner/North Willow Glen	Fuller Park/Fuller Avenue recreational amenities	Would offset community concerns, build trust, and alignment with commitments from the City to ensure that visual conditions are no worse, and ideally are better than today, even with train volume increase. Community highly concerned with Fuller Park and does not agree to EIR/EIS analysis of effects on Fuller Park.	N/A

Respondent Name	Community	Improvement Description	Reasons Proposed	Reasons Cited As Better Addressing Concerns in the Community
City San Jose	Gardner/North Willow Glen	The Authority should coordinate Gardner Elementary School noise improvements with VTA's sound wall project nearby.	Help offset noise effects on community.	N/A
Rocketship	Washington, Guadalupe, Tamien, Alma, Almaden	Improvements at/adjacent to Rocketship Matteo Sheedy School: 1. New playground or playground enhancements. 2. Building repairs such as new roof or repairs in order to provide a proper space for the students and community. 3. New PA system. 4. Building and community aesthetics (e.g., trees, new grass, or turf). 5. Pedestrian and traffic safety remedies, such as “STOP AHEAD” painted on Virginia before the stop sign, more School Zone signs, speed bump, etc.	1. Provide community with better experience during and after school hours. 2. Mitigate some of the noise problems that will arise during construction and after with the increase of traffic. 3. Improve community aesthetics.	N/A
Individual	Washington, Guadalupe, Tamien, Alma, Almaden	Fund murals by local artists for any project noise walls or structures with paintable surfaces.	To reduce vandalism and potential violence due to gang graffiti. Guadalupe Washington is a gang hot spot in San Jose, classified as such by the City government. Any blank walls (without murals) will get vandalized. Please consider paying for wall art by LOCAL muralists. I emphasize local because the mural also needs to be respected by the residents and gangs, so it doesn't get vandalized.	N/A
City of San Jose	South San Jose	Grade separations at Skyway, Branham, Chynoweth.	Reduce noise, traffic, safety (including emergency vehicle response), and quality of life effects on community.	Pedestrian/bike overcrossings help to address pedestrian/bike safety but do not address traffic delays, horn sounding, or emergency vehicle delays due to increased gate-down times.

Respondent Name	Community	Improvement Description	Reasons Proposed	Reasons Cited As Better Addressing Concerns in the Community
City of San Jose	South San Jose	Allow for funding of pedestrian/bike overcrossings at Skyway, Branham, Chynoweth to be used for grade separation projects.	Reduce noise, traffic, safety (including emergency vehicle response), and quality of life effects on community.	Pedestrian/bike overcrossings help to address pedestrian/bike safety but do not address traffic delays, horn sounding, or emergency vehicle delays due to increased gate-down times.
Oak Grove School District	South San Jose	Caroline Davis Intermediate School all weather turf and track.	Caroline Davis Intermediate School provides green open space for the community in the area and not just students. School serves the entire South San Jose environmental justice community area assessed by the Authority. Extensive gathering space before and during COVID-19 emergency shows importance of space to community.	The new track would allow free public access to a community exercise venue and gathering space, which increases community cohesion and connection. Nearly all residences with intermediate age children have them attend Caroline Davis, so the improvement touches most residents through students as well as through community use of the space. Creates sense of community. While Authority method of doing "like for like" is logical, the Authority should consider improvements more broadly from the perspective of value to the community overall.
City of Morgan Hill	Morgan Hill	The Authority should fund a 30% design for grade separations at Tilton Avenue, East Dunne Avenue, and Tennant Avenue.	Impacts on public safety, emergency vehicle response times, circulation impacts, and quality of life.	Circulation and safety are the primary concerns in the community. Grade separations would alleviate this concern.
City of Morgan Hill	Morgan Hill	The Authority should fund a 30% design for a master plan of the pedestrian underpass and train station.	Impacts on public safety, circulation impacts, and access.	N/A
City of Morgan Hill	Morgan Hill	Install "purple pipe" for recycled water along Tennant Ave.	To support water conservation.	N/A

Respondent Name	Community	Improvement Description	Reasons Proposed	Reasons Cited As Better Addressing Concerns in the Community
City of Morgan Hill	Morgan Hill	Install telecommunication conduits to provide internet access to those within the environmental justice community along Tennant Ave.	To provide internet access to environmental justice community.	N/A
Morgan Hill Unified School District	Morgan Hill	School bus route study in Morgan Hill.	Identify the impacts and suggest routing alternatives/bus crossings to minimize the impact on student transit times.	Mitigate the potential negative impact to school bus transit as a result of Alternatives 1–4.
Gilroy Unified School District	Gilroy	The Authority should select Alternative 4 but should fund ALL potential community improvements for Gilroy.	To mitigate impacts of Alternative 4 on the disadvantaged communities.	N/A
Rebekah Children's Services	Gilroy	New secure gate and fence at the RCS facility in Gilroy.	Would improve facility safety since safety is one of the residual effects of Alternative 4 in Gilroy.	N/A

AACSA = African American Community Services Agency
Authority = California High-Speed Rail Authority
DISC = Diridon Station Integrated Concept
DPW = Department of Public Works
HSR = high-speed rail
N/A = not applicable
PA = public address
RCS = Rebekah Children's Services
SR = State Route
VTA = (Santa Clara) Valley Transportation Authority

APPENDIX 5-B, ATTACHMENT D-2: COPY OF OUTREACH MATERIALS DISTRIBUTED

Updated Environmental Justice Analysis for the Final EIR/EIS: San Jose to Merced Project Section

(September 2021)

Summary of Environmental Justice Requirements

The California High-Speed Rail Authority (Authority), has prepared an environmental justice analysis pursuant to requirements of state and federal law. Under federal law, agencies must analyze whether actions would result in disproportionately high and adverse effects to minority and low-income populations, identify feasible ways to avoid or reduce those effects, engage with affected communities and disclose the analysis and findings in the National Environmental Policy Act (NEPA) documentation. The Authority continues to consider how the project will affect communities and as part of the ongoing outreach the Authority is considering potential updates to the analysis as noted below.

Updates to Analysis

In consideration of comments on the Draft EIR/EIS, review of the environmental justice analysis, and guidance, the Authority has made the following updates to the analysis:

- The **methodology** section was clarified to match the definition of disproportionately high and adverse effects in the most recent US Department of Transportation guidance. Clarifications did not substantially change the overall conclusions.
- The **summary of environmental justice engagement** is being updated to include additional outreach and engagement since circulation of the Draft EIR/EIS.
- The **Assessment of Effects** is being updated to reflect the following:
  - Full consideration of project benefits.
  - Additional or updated mitigation measures for traffic, construction bus transit delay, emergency vehicle response, residential displacements and noise.
  - Refined analysis of traffic, construction bus transit delay, emergency vehicle response, displacements, noise and vibration.
- **Community Improvements**. The Authority has been evaluating community improvements in collaboration with affected communities since late 2019. The Authority is now considering implementation of certain potential community improvements where they would offset residual disproportionately high and adverse effects after consideration of mitigation and project benefits.
- **Preliminary Conclusions**. The conclusions are now being refined considering the updated analysis, new and updated direct mitigation, project benefits, potential community improvements, and the views and concerns of affected minority and low-income populations along the project corridor.

Next Steps

The Authority is currently seeking public input. Please submit any feedback by October 1, 2021 (see cover letter for details as to where to submit feedback). The Authority will consider input from affected communities during outreach in September 2021 and will incorporate such feedback into the Final EIR/EIS, as appropriate.

California High Speed Rail Project
San Jose to Merced Project Section
Environmental Justice Analysis Process

The Authority has engaged with environmental justice communities along the San Jose to Merced Project Section for many years, conducted analysis of potential effects to these communities, and developed potential mitigation and community improvements considering community input throughout:

Initial EJ Outreach (2016-2019): Extensive outreach throughout the EIR/EIS development process included targeted outreach to potentially affected minority populations and low-income populations. Initial environmental justice outreach activities included presentations at public and stakeholder group meetings, interviews with local stakeholders, informational tabling at various types of community events, and online community webinars, through which feedback was obtained from environmental justice organizations, community leaders, and community members during community events. The purpose of these outreach efforts was to provide opportunities for meaningful participation and input into the project design, identification of disproportionately high and adverse effects, and development of mitigations.

Draft EIR/EIS EJ Analysis (2017-2020): Chapter 5, *Environmental Justice*, of the EIR/EIS contains the analysis of the project's effects on minority populations and low-income populations. The chapter describes the existing conditions related to the environmental justice communities in the project study area; summarizes the environmental justice engagement and key issues and concerns; analyzes the potential effects of the project alternatives on environmental justice communities; and identifies whether the project alternatives would have a disproportionately high and adverse effect. The analysis considered the application of mitigation and generally considered project benefits that could reduce disproportionately high and adverse project effects. The Draft EIR/EIS was published for public review and comment in April 2020.

Community Improvements Outreach Phase I (December 2019-March 2020): Community Improvements Outreach Phase I consisted of stakeholder interviews, community meetings, and focus groups with a total of 44 meetings. Presentations were to a multitude of local minority and low-income community organizations, including community-based service providers, school leaders, community groups, neighborhood associations, churches and other faith-based organizations, and community leaders and representatives, along with public agency representatives and elected officials representing relevant areas. During this engagement, the Authority solicited input for potential improvement concepts to be considered and identified potential partner agencies or entities that would be involved with implementing each improvement concept. Potential implementing partners include jurisdictions, agencies (e.g., school districts), and other organizations who would be the entities that would work with the Authority to implement specific improvements.

Development and Evaluation of Community Improvement Concepts (February-June 2020): The list of potential improvements developed by the Authority based on identified past plans and projects was expanded during Outreach Phase I to include the improvements suggested by cities, agencies, community organizations, and community representatives. This expanded list was then subject to another round of screening to determine which improvements would be developed and considered in greater detail. The improvements carried forward were refined based on input from potential partners and community stakeholders to ensure that they would meet community needs and priorities. The improvements were then evaluated based on the set of established evaluation criteria such as feasibility and relative benefit to minority populations and low-income populations.

Public Review of the Draft EIR/EIS (April-June 2020): The Draft EIR/EIS was distributed to agencies, stakeholders, organizations, and the public for their review and comment. The Draft EIR/EIS includes the analysis of environmental justice in Chapter 5 of the document. Numerous agencies, stakeholders, organizations, and individuals submitted comments on the project's alternatives, potential effects, the environmental justice analysis, and proposed mitigations.

Community Improvements Outreach Phase II (July-August 2020): After development and evaluation of the improvement concepts collected and refined during Outreach Phase I, the Authority undertook a second phase of outreach to gather feedback from potential implementing partners. The Authority shared the evaluation of the improvements that were advanced for detailed evaluation with potential implementing partners through a series of 12 meetings as well as follow up email and phone communications. The potential partners provided input on the improvements that were a priority for them, the methodology being used for the evaluation, the description of the improvements, and in some cases new concepts for improvements.

Refinements of Potential Community Improvements (October 2020-July 2021): Following public review of the Draft EIR/EIS, the Authority considered comments provided from local community members, organizations, and agencies. The Authority developed a potential list of community improvements it is considering implementing based on the list of community improvements that would offset residual disproportionately high and adverse effects of the project alternatives.

Outreach Phase III (September 2021): During this (**current**) phase of outreach, the Authority is presenting our latest assessment of impacts and project benefits that environmental justice communities could experience as a result of the project and the community improvements the Authority is considering implementing to address these impacts. Meetings are being held with implementing partners, community organizations, stakeholders, and representatives of local communities with the goal of obtaining feedback on our impact assessment, evaluation of project benefits, and the community improvements under consideration. Meetings are being held with agency partners and community stakeholders in each of the affected communities. The feedback gathered during this phase will be evaluated and incorporated into the Authority's Final EIR/EIS, as appropriate. **Feedback for this phase is being requested by no later than October 1, 2021.**

Final EIR/EIS (October 2021-February 2022): After Outreach Phase III, the EIR/EIS will be revised, as appropriate, to reflect the feedback gathered from implementing partners, community organizations, and stakeholders regarding the project effects, project benefits, potential community improvements, and the preliminary conclusions. The Final EIR/EIS will include the Authority's environmental justice analysis, findings, and conclusions for Board consideration in deciding whether to approve this project section.

California High Speed Rail
San Jose to Merced Project Section
Environmental Justice Outreach (September 2021)
GLOSSARY OF KEY TERMS

- **Disproportionately High and Adverse Effects** = The focus of the environmental justice analysis is to determine whether the project would result in high and adverse effects that disproportionately affect minority populations or low-income populations.
- **Direct Mitigation** = Measures in the EIR/EIS that directly avoids, minimizes, reduces, or compensates for identified adverse effects.
- **Project Benefits** = As explained in the EIR/EIS, the high-speed rail project would result in a number of benefits including the following: quick and efficient travel in California; access to jobs, goods, and services; integration with local transit connections and services; reduction of highway traffic; upgrades to railroad safety and signaling systems; reduced need for airport and highway expansion; reduced air pollution; reduced greenhouse gas emissions; construction Spending and employment; operational spending and employment; and support for transit-oriented development near stations.
- **Community Improvements** = Any upgrading of an existing community facility, structure, function or action, or addition of a facility, structure, function, or action that is made solely for the benefit of the local community, including an increase in the capacity, capability, efficiency, duration, function, or action over existing conditions. Community improvements do not include the following: proposed elements of the high-speed rail project; feasible direct mitigation to address significant adverse environmental effects as defined in the project EIR/EIS; improvements mandated by existing local, state, or federal mandates; or improvements fully funded by dedicated existing funding sources. At present, the Authority is only considering community improvements that have a close relationship between a disproportionately high and adverse effect and the benefits of the community improvement. For example, a community improvement that promotes community safety would have a close relation to residual safety effects.
- **HSR** = high-speed rail
- **CHSRA or Authority** = California High Speed Rail Authority
- **NEPA =** National Environmental Policy Act, which requires federal agencies to analyze the environmental effects of their actions, including effects on minority populations and low-income populations, consider ways to reduce adverse effects, disclose their findings in environmental documents, and provide opportunities for the public to provide input on the agency evaluation.
- **CEQA = California Environmental Quality Act**, which requires state agencies to analyze the environmental effects of their actions, identify feasible mitigation to address significant impacts, disclose their findings in environmental documents, and provide opportunities for the public to provide input on the agency evaluation.
- **Environmental Impact Report/Environmental Impact Statement (EIR/EIS)** = A report disclosing the environmental impacts of the high-speed rail project, prepared in accordance with the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA).

California High Speed Rail
San Jose to Merced Project Section
Gardner/Willow Glen Community Area
Potential Community Improvements (September 2021)

The Authority is seeking community input on the importance or value of community improvements to community members. These improvements were considered and evaluated during the community improvements planning process from November 2019 through July 2021 (See separate handout describing that process).

The Authority is considering implementation of the potential improvements listed in the first table below because they have a close relationship to the potential residual disproportionately high and adverse effects (DHAEs) in this community area and would help to offset those effects.

The other improvements considered are listed in the second table and are not currently being considered for implementation because they lack a close relationship to potential residual disproportionately high and adverse effects in this community.

The Authority may consider changes in potential community improvements after consideration of community input through outreach in September 2021.

Potential Improvements	Relationship to potential residual DHAEs for HSR Alternatives	Benefits	Alternatives
GWG-IMP#1: Gardner Elementary Noise Insulation or Soundwalls	School noise improvements offsets noise DHAE in Gardner/Willow Glen area	Improvement to educational environment	4
GWG-IMP#2: Noise Insulation for certain Residential Buildings adjacent to the west side of SR 87 (between W. Virginia St. and Brown St.)/adjacent to the south side of I-280 (between Spencer Ave. and Los Gatos Creek) to Address Existing Noise	Community noise improvements offsets noise DHAE in Gardner/Willow Glen area	Noise abatement, improved livability, health benefits	4

Other Improvements Considered	Benefits	Ranking[1] (Among Other Improvements Considered)
Fuller Park/Fuller Avenue Recreational Amenities	Recreation, community cohesion, livability	1
Biebrach Park Improvements	Recreation, health, livability	2
West Virginia Railroad Crossing Warning Lights	Safety, community cohesion	3
Delmas Avenue Streetscape and Crossings	Safety, visual quality, livability, community cohesion	4
Bird Avenue North-South improvements	Safety, connectivity, transportation	5
West Virginia Streetscape and Pedestrian Crossings	Safety, visual quality, livability, community cohesion	6
Neighborhood Lighting	Visual quality, safety	7
Three Creeks Trail Extension Crossing of SR 87/Caltrain/HSR	Recreation, safety, connectivity, health, livability	8
National Night Out Contribution	Safety, community cohesion	9
West Virginia Ave Pedestrian/Bicycle Crossing	Safety, livability, community cohesion, connectivity, health, recreation	10
Community Art	Visual quality, community connection/identity	11
Guadalupe River Trail Pedestrian Crossing at Willow Street	Recreation, safety, connectivity, health	12
Guadalupe River Trail Extension (Virginia to Curtner)	Health, livability, health, connectivity, community cohesion	13
Biebrach Park Connection to Fuller Park	Safety, community cohesion, connectivity, health, recreation	14
West Virginia Pocket Park at Prevost South of West Virginia Street	Health, recreation, livability	14
Jerome/Illinois to Bird Avenue Pedestrian Pathway	Safety, health, connectivity, community cohesion	15
West Virginia Pocket Park South of West Virginia Railroad Crossing	Health, recreation, livability	16

[1] The ranking of the other improvements was completed in summer 2020 using the following evaluation criteria: benefit intensity, relative number of beneficiaries, practicability, defined project or action, satisfying Authority obligations, defined roles and responsibilities, evidence of agreement, and cost-effectiveness. The ranking provides a general sense of how these other improvements measure up against each other against a broad set of criteria.

California High Speed Rail,
San Jose to Merced Project Section
Washington, Guadalupe, Tamien, Alma, Almaden Area
Potential Community Improvements (September 2021)

The Authority is seeking community input on the importance or value of community improvements to community members. These improvements were considered and evaluated during the community improvements planning process from November 2019 through July 2021 (See separate handout describing that process).

The Authority is considering implementation of the potential improvements listed in the first table below because they have a close relationship to the potential residual disproportionately high and adverse effects (DHAEs) in this community area and would help to offset those effects.

The other improvements considered are listed in the second table and are not currently being considered for implementation because they lack a close relationship to potential residual disproportionately high and adverse effects in this community.

The Authority may consider changes in potential community improvements after consideration of community input through outreach in September 2021.

Potential Improvements	Relationship to potential residual DHAEs for HSR Alternatives	Benefits	Alternatives
WGTA-IMP#1: Community Art	Community aesthetic/character improvement partially offsets visual aesthetics DHAE in Washington, Guadalupe, Tamie, Alma, Almaden	Enhanced neighborhood visual quality, identify, and livability	1,2,3
WGTA-IMP#2: Streetscape Improvements (Goodyear, Humboldt, Floyd)	Investment in community aesthetics partially offsets visual aesthetics DHAE in Washington, Guadalupe, Tamien, Alma, Almaden	Visual quality, safety, and livability	1,2,3
WGTA-IMP#3: Noise insulation for certain residential buildings adjacent to the east side of SR 87 (between Virginia St. and Shadowgraph Drive) to address existing noise	Community noise improvements offsets noise DHAE in Washington, Guadalupe, Tamien, Alma, Almaden	Noise abatement, improved livability, health benefits	4

Other Improvements Considered	Benefits	Ranking[1] (Among Other Improvements Considered)
Tamien Park Westside Fencing along Railroad	Safety, recreation, health	1
Washington School Recreation Improvements	Recreation, health, livability	2
Rocketship Mateo Sheedy Elementary School Play Fields/Landscaping	Safety, recreation, livability	3
Alma Community Center and Teen Center Improvements	Recreation, education	4
Washington Elementary School Pedestrian and Bicycle Safety Improvements	Safety, health, recreation, community cohesion, livability	5
Pedestrian and Bicycle Crossing Safety Improvements	Safety, recreation, health, community cohesion	6
Oak/Almaden Pocket Park	Recreation, livability	7
Bellevue Park Improvements.	Recreation, health, livability	8
Traffic Calming	Safety, connectivity, livability	9
Healing Grove Health Center Sports/Outdoor Activity/Arts Programs	Recreation, health, livability	10
Rocketship Mateo Sheedy Elementary School Circulation and Safety Improvements	Safety	11
Guadalupe River Trail Pedestrian Crossing at Willow Street	Recreation, safety, connectivity, health	12
Three Creeks Trail Extension Crossing of SR 87/Caltrain/HSR	Recreation, safety, connectivity, health, livability	13
Guadalupe River Trail Extension (Virginia to Curtner)	Health, livability, health, connectivity, community cohesion	14

The ranking provides a general sense of how these other improvements measure up against each other against a broad set of criteria.

Environmental Justice Analysis: San Jose to Merced (as of July 2021)

GARDNER/WILLOW GLEN

The EIR/EIS for the San Jose to Merced project section evaluates effects on communities along the project alignment. Where adverse effects are identified, the Authority considers ways to mitigate these effects. The information provided below is preliminary as the Authority seeks community input to advance our environmental review. The Authority's conclusions will be included in the Final EIR/EIS for the project section after consideration of feedback through this round of outreach. After direct mitigation(meaning measures that avoid, minimize, or directly compensate for an adverse impact), the Authority evaluated the remaining effects for the entire project section (from Santa Clara to the Central Valley) to determine if there would be disproportionately high and adverse effects (DHAEs) to minority and/or low-income populations overall. Although there may be DHAEs based on analysis of the entire project section, DHAEs may not necessarily be found in each community along the alignment. The table below shows the outcomes of the EIR/EIS analysis in the Gardner/Willow Glen community area before consideration of project benefits or community improvements.

Summary of Potential Effects
Gardner/Willow Glen

Effects	Alternatives			
	1	2	3	4
Aesthetics and Visual Quality	○	○	○	○
Residential Displacements				◎
Business Displacements [1]				
Emergency Response Delays [1]				
Parks [2]				○
Operational Noise Effects				●
Operational Vibration				◎
Construction Traffic/Bus Transit Delay				○
Operational Traffic				○

● Potential disproportionately high and adverse effects (DHAE).

◎ Potential Effects *not* DHAE for the entire project section, but a particular community may still be affected.

○ Potential Effects not considered high and adverse.

The EIR/EIS identifies other effects (beyond the nine shown above), none of which would have a DHAE on minority and/or low-income populations. All effects are important regardless of whether they have a DHAE or not.

[1] No business displacements or emergency response delays in community. [2] Alternative 4 would require acquisition of a small portion (.03 ac) of Fuller Park, but this effect is not considered high and adverse because it would not compromise recreational use of the park.

GARDNER/WILLOW GLEN (p. 2)

As shown in the table above, in the Gardner/Willow Glen community area, with direct mitigation, there would be the following residual DHAEs:

- **Operational Noise:** The adverse operational noise effects with Alternative 4 are related to at-grade train operations.

Consideration of Project Benefits and Potential Community Improvements

The project will have a wide range of benefits to both general populations in the project area and also to minority and low-income populations along the project alignments including the following:

- **Regional and intrastate travel options**: The high-speed rail project will provide a fast and efficient connection from San Jose and Gilroy to San Francisco, the Central Valley, and Southern California. Travel by high-speed rail is safer and faster than travel by personal vehicle.
- **Increased transit connectivity:** The high-speed rail service will be connected to other transit services in San Jose and Gilroy (and at other system stations) that allow travelers to take full advantage of transit connections. For example, between Santa Clara and Gilroy, riders can use Caltrain to connect to and from high-speed rail service from their local Caltrain stations.
- **Reduction of vehicle miles travelled on regional roadways**: The high-speed rail project will divert cars from regional highways such as I-880, US 101, I-280, SR87, SR85, and SR 152 which will benefit local residents who travel along these roadways.
- **Reduced need for expanding airports and highways:** By providing an alternative to long-distance passenger vehicle and airplane travel, the project will reduce the need to expand existing airports and highways which would otherwise affect residents adjacent to such facilities who would be affected by expansion, traffic increases, noise, and other effects.
- **Construction and operational spending and employment:** The high-speed rail project will provide jobs during construction and operation as well as spending locally on materials and supplies which will provide employment opportunities for local residents and economic welfare of local areas.
- **Improved regional air quality:** By reducing onroad vehicle travel and replacing it with electrified trains operating on renewable energy, the high-speed rail project will improve regional air quality which will improve health conditions for local and regional residents.
- **Reduced greenhouse gas emissions:** By reducing onroad vehicle travel and replacing it with electrified trains operating on renewable energy, the high-speed rail project will reduce greenhouse gas emissions which will help to reduce the effects of climate change over time.

The offsetting value of these project benefits relative to the residual DHAEs noted above for the Gardner/Willow Glen community was evaluated as follows:

- **Operational Noise:** While the project would reduce adverse noise effects associated with airport and highway expansion, this would not fully offset the adverse noise effects with Alternative 4 in this community area.

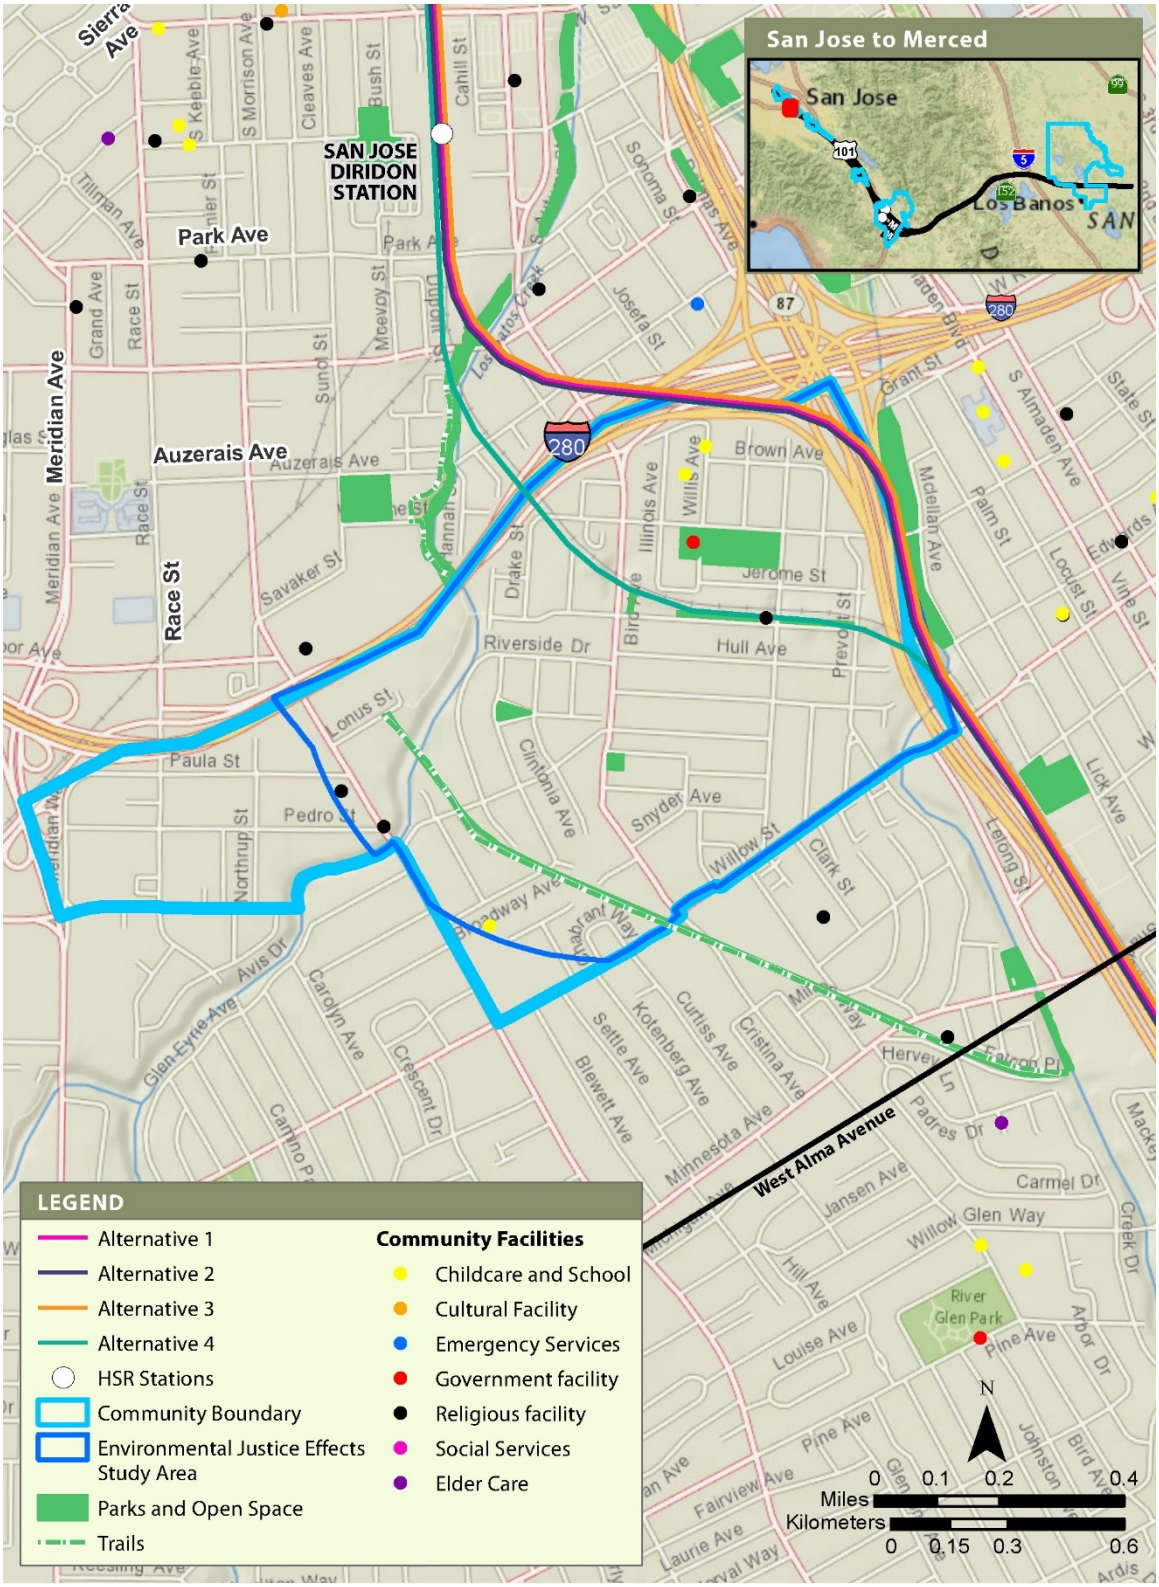
The Authority has identified the following community improvements:

- **Alternative 4:**
  - The Authority would install noise insulation for existing residences immediately adjacent to the west side of SR 87 (between W. Virginia St. and Brown St.) and to the south side of I-280 (between Spencer Ave. and Los Gatos Creek) to reduce noise effects from existing highway traffic.
  - The Authority would provide funding to the San Jose Unified School District to provide noise treatments to benefit the Gardner Elementary School.

These measures would reduce community noise effects sufficient to offset the DHAEs related to noise with Alternative 4 in this community area.

Preliminary Conclusion

After consideration of direct mitigation, project benefits and potential community improvements, there would potentially be no disproportionately high and adverse effects with any of the alternatives in the Gardner/Willow Glen community area.



Gardner/Willow Glen Community Area

Environmental Justice Analysis: San Jose to Merced (as of July 2021)

WASHINGTON/GUADALUPE/TAMIEN/ALMA/ALMADEN

The EIR/EIS for the San Jose to Merced project section evaluates effects on communities along the project alignment. Where adverse effects are identified, the Authority considers ways to mitigate these effects. The information provided below is preliminary as the Authority seeks community input to advance our environmental review. The Authority's conclusions will be included in the Final EIR/EIS for the project section after consideration of feedback through this round of outreach. After direct mitigation(meaning measures that avoid, minimize, or directly compensate for an adverse impact), the Authority evaluated the remaining effects for the entire project section (from Santa Clara to the Central Valley) to determine if there would be disproportionately high and adverse effects (DHAEs) to minority and/or low-income populations overall. Although there may be DHAEs based on analysis of the entire project section, DHAEs may not necessarily be found in each community along the alignment. The table below shows the outcomes of the EIR/EIS analysis in the Washington/Guadalupe/Tamien/Alma/Almaden community area before consideration of project benefits or community improvements.

Summary of Potential Effects
Washington/Guadalupe/Tamien/Alma/Almaden

Effects	Alternatives			
	1	2	3	4
Aesthetics and Visual Quality	●	●	●	○
Residential Displacements [1]				
Business Displacements	○	○	○	
Emergency Response Delays [1]				
Parks [2]	○	○	○	○
Operational Noise Effects	○	○	○	●
Operational Vibration	○	○	○	○
Construction Traffic/Bus Transit Delay	○	○	○	○
Operational Traffic [1]				

● Potential disproportionately high and adverse effects (DHAE).

○ Potential Effects *not* DHAE for the entire project section, but a particular community may still be affected.

○ Potential Effects not considered high and adverse.

The EIR/EIS identifies other effects (beyond the nine shown above), none of which would have a DHAE on minority and/or low-income populations. All effects are important regardless of whether they have a DHAE or not.

[1] No residential displacements, emergency response delays, or operational traffic adverse effects in community. [2] There would be acquisition of a portion of the SR 87 Bikeway north and the planned location of the three creek trails, but the trails would be relocated after construction. For Alternatives 1, 2 and 3, there would also be acquisition of a portion of the sports field adjacent to the Tamien Station for a viaduct footing, but the permanent encroachment would only be underground.

WASHINGTON/GUADALUPE/TAMIEN/ALMA/ALMADEN (p. 2)

As shown in the table above, in the Washington/Guadalupe/Tamien/Alma/Almaden community area, with direct mitigation, there would be the following residual DHAEs:

- **Aesthetics and Visual Quality:** The adverse visual effects for Alternatives 1, 2, and 3 are related to the aerial viaduct, which will be observable to residents along the high-speed rail alignment.
- **Operational Noise:** The adverse operational noise effects with Alternative 4 are related to at-grade train operations.

Consideration of Project Benefits and Potential Community Improvements

The project will have a wide range of benefits to both general populations in the project area and also to minority and low-income populations along the project alignments including the following:

- **Regional and intrastate travel options**: The high-speed rail project will provide a fast and efficient connection from San Jose and Gilroy to San Francisco, the Central Valley, and Southern California. Travel by high-speed rail is safer and faster than travel by personal vehicle.
- **Increased transit connectivity:** The high-speed rail service will be connected to other transit services in San Jose and Gilroy (and at other system stations) that allow travelers to take full advantage of transit connections. For example, between Santa Clara and Gilroy, riders can use Caltrain to connect to and from high-speed rail service from their local Caltrain stations.
- **Reduction of vehicle miles travelled on regional roadways**: The high-speed rail project will divert cars from regional highways such as I-880, US 101, I-280, SR87, SR85, and SR 152 which will benefit local residents who travel along these roadways.
- **Reduced need for expanding airports and highways:** By providing an alternative to long-distance passenger vehicle and airplane travel, the project will reduce the need to expand existing airports and highways which would otherwise affect residents adjacent to such facilities who would be affected by expansion, traffic increases, noise, and other effects.
- **Construction and operational spending and employment:** The high-speed rail project will provide jobs during construction and operation as well as spending locally on materials and supplies which will provide employment opportunities for local residents and economic welfare of local areas.
- **Improved regional air quality:** By reducing onroad vehicle travel and replacing it with electrified trains operating on renewable energy, the high-speed rail project will improve regional air quality which will improve health conditions for local and regional residents.
- **Reduced greenhouse gas emissions:** By reducing onroad vehicle travel and replacing it with electrified trains operating on renewable energy, the high-speed rail project will reduce greenhouse gas emissions which will help to reduce the effects of climate change over time.

The offsetting value of these project benefits relative to the residual DHAEs noted above for the Washington/Guadalupe/Tamien/Alma/Almaden community was evaluated as follows:

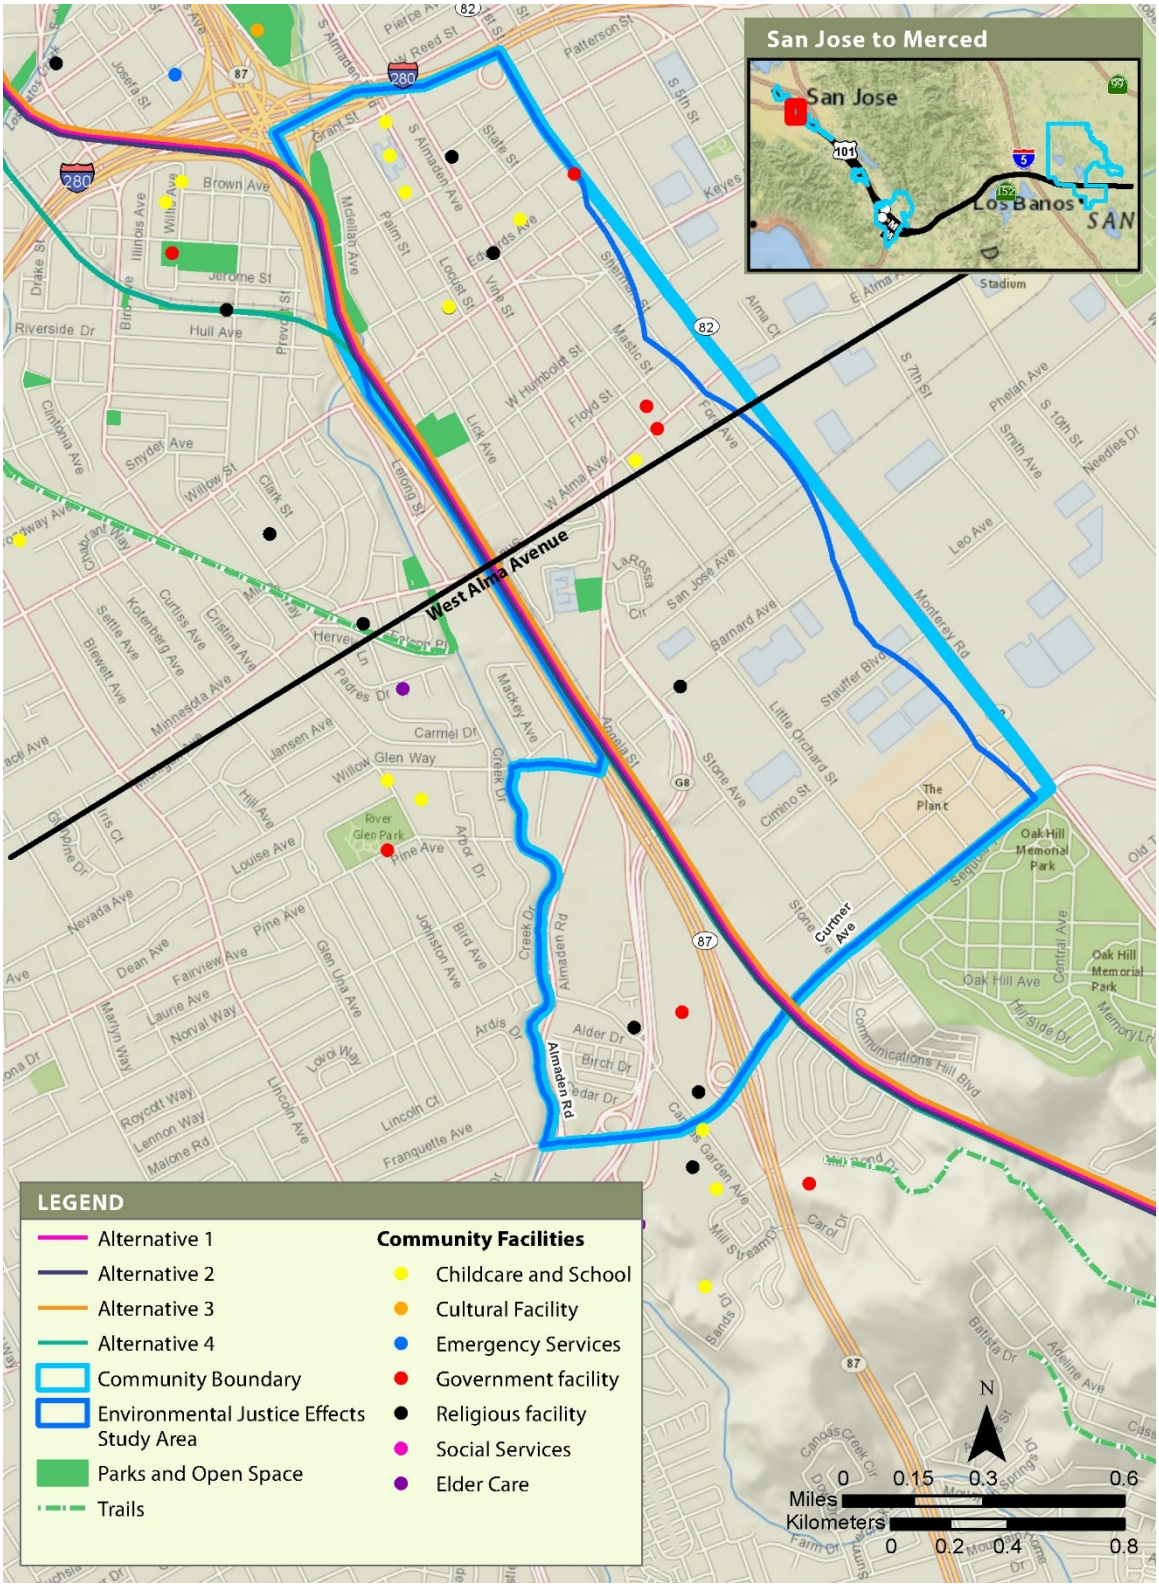
- **Aesthetics and Visual Quality/Operational Noise**: While the project would reduce adverse visual effects and noise effects associated with airport and highway expansion, this would not fully offset the adverse visual effects for Alternatives 1, 2, and 3 or the adverse noise effects with Alternative 4 in this community area.

The Authority has identified the following community improvements:

- **Alternatives 1, 2, and 3:**
  - The Authority would provide funding for the City of San Jose to implement streetscape improvements along Goodyear Street, Humboldt Street, and Floyd Street to improve both visual aesthetics and safety for local residents.
  - The Authority would provide funding, in partnership with local artists, community organizations and the City of San Jose, to support community art installations in the local community, which will also help to improve visual aesthetics and a sense of community.
  - While the streetscape and community art measures will help improve community aesthetics, they are not considered sufficient to offset the DHAEs of the aerial viaduct with Alternatives 1, 2 and 3 in this community area.
- **Alternative 4:** The Authority would install noise insulation for residential buildings immediately adjacent to the east side of SR 87 (between Virginia St. and Shadowgraph Drive) to reduce noise effects from existing highway traffic. This measure would reduce community noise effects sufficient to offset the adverse noise effects with Alternative 4 in this community area.

Preliminary Conclusion

After consideration of direct mitigation, project benefits and potential community improvements, there would potentially remain disproportionately high and adverse effects with Alternatives 1, 2 and 3 due to the aerial viaduct. After consideration of direct mitigation, project benefits and potential community improvements, there would potentially be no disproportionately high and adverse effects with Alternative 4 in the Washington/Guadalupe/Tamien/Alma/Almaden community area.



Washington/Guadalupe/Tamien/Alma/Almaden Community Area

Environmental Justice Analysis: San Jose to Merced (as of July 2021)

GILROY

The EIR/EIS for the San Jose to Merced project section evaluates effects on communities along the project alignment. Where adverse effects are identified, the Authority considers ways to mitigate these effects. The information provided below is preliminary as the Authority seeks community input to advance our environmental review. The Authority's conclusions will be included in the Final EIR/EIS for the project section after consideration of feedback through this round of outreach. After direct mitigation(meaning measures that avoid, minimize, or directly compensate for an adverse impact), the Authority evaluated the remaining effects for the entire project section (from Santa Clara to the Central Valley) to determine if there would be disproportionately high and adverse effects (DHAEs) to minority and/or low-income populations overall. Although there may be DHAEs based on analysis of the entire project section, DHAEs may not necessarily be found in each community along the alignment. The table below shows the outcomes of the EIR/EIS analysis in the Gilroy community area before consideration of project benefits or community improvements.

Summary of Potential Effects
Gilroy

Effects	Alternatives			
	1	2	3	4
Aesthetics and Visual Quality	●	●	●	○
Residential Displacements	◎	●	◎	◎
Business Displacements	●	●	◎	●
Emergency Response Delays	○	○	○	●
Parks [1]	○	●		
Operational Noise Effects	●	●	○	●
Operational Vibration	○	○	○	○
Construction Traffic/Bus Transit Delay [2]	●	●	○	○
Operational Traffic	○	●	○	●

● Potential disproportionately high and adverse effects (DHAE).

◎ Potential Effects *not* DHAE for the entire project section, but a particular community may still be affected.

○ Potential Effects not considered high and adverse.

The EIR/EIS identifies other effects (beyond the nine shown above), none of which would have a DHAE on minority and/or low-income populations. All effects are important regardless of whether they have a DHAE or not.

[1] Acquisition of portion of school play area at the South Valley Middle School. [2] Bus delays during construction.

GILROY (p. 2)

As shown in the table above, in the Gilroy community area, with direct mitigation, there would be the following residual DHAEs:

- **Aesthetics and Visual Quality:** The adverse visual effects for Alternatives 1, 2, and 3 are related to either the aerial viaduct (Alternative 1 and 3) or the elevated embankment (Alternative 2), which will be observable to residents along the high-speed rail alignment.
- **Residential/Business Displacement:** The adverse residential displacement (Alternative 2) and business displacement effects (Alternatives 1, 2 and 4) would occur because there is inadequate relocation availability in Gilroy to absorb the amount of displacements that would occur.
- **Emergency Response Delay:** The adverse emergency response delays for Alternative 4 are related to increased gate down time at the at-grade crossings. Adverse delays greater than the delay threshold could occur if the City of Gilroy chooses to not implement the improvements included in proposed direct mitigation measure SS-MM#4 based on the construction funding and partial operational funding proposed by the Authority.
- **Parks**: The adverse park effects for Alternative 2 are related to acquisition of part of the field and track for the South Valley Middle School.
- **Operational Noise:** The adverse operational noise effects with Alternatives 1, 2 and 4 are related to train operations.
- **Construction Bus Transit Delay:** The adverse bus transit delays during construction with Alternative 2 would occur on a temporary basis due to roadway modifications when there is a requirement for closure or partial closure of roadways.
- **Operational Traffic:** The adverse operational traffic effects are related to changes in roadways (Alternative 2) or due to increased gate-down time at the at-grade crossings (Alternative 4).

Consideration of Project Benefits and Community Improvements

The project will have a wide range of benefits to both general populations in the project area and also to minority and low-income populations along the project alignments including the following:

- **Regional and intrastate travel options**: The high-speed rail project will provide a fast and efficient connection from San Jose and Gilroy to San Francisco, the Central Valley, and Southern California. Travel by high-speed rail is safer and faster than travel by personal vehicle.
- **Increased transit connectivity:** The high-speed rail service will be connected to other transit services in San Jose and Gilroy (and at other system stations) that allow travelers to take full advantage of transit connections. For example, between Santa Clara and Gilroy, riders can use Caltrain to connect to and from high-speed rail service from their local Caltrain stations.

- **Reduction of vehicle miles travelled on regional roadways**: The high-speed rail project will divert cars from regional highways such as I-880, US 101, I-280, SR87, SR85, and SR 152 which will benefit local residents who travel along these roadways.
- **Reduced need for expanding airports and highways:** By providing an alternative to long-distance passenger vehicle and airplane travel, the project will reduce the need to expand existing airports and highways which would otherwise affect residents adjacent to such facilities who would be affected by expansion, traffic increases, noise, and other effects.
- **Construction and operational spending and employment:** The high-speed rail project will provide jobs during construction and operation as well as spending locally on materials and supplies which will provide employment opportunities for local residents and economic welfare of local areas.
